ROGERS, Jacob S., American manufacturer: b. Paterson, N. J., 1823; d. New York, 2 July 1901. In 1856 he became head of the Rogers Locomotive and Machine Works of Paterson. He retired from active business in 1897, and upon the completion of outstanding contracts closed the works 1 Dec. 1900. He bequeathed the bulk of his estate to the Metropolitan Museum of Art, New York. Litigation was begun by other legatees, but a settlement was effected by the payment to these of \$250,000. The residuary estate, about \$5,000,000, went to the museum.

ROGERS, James Edwin Thorold, English economist: b. West Meon, Hampshire, 1823; d. Oxford, 12 Oct. 1890. He was educated at King's College, London, and at Oxford, took orders in the Established Church, and was appointed curate of Saint Paul's, Oxford. After 1860 he lost sympathy with the Tractarian movement and in 1870 was the first to take advantage of the new Clerical Disabilities Relief Act to resign his orders. He received the Tooke professorship of statistics and economic science at King's College, London, in 1859. In 1862 he was elected for five years Drummond professor of political economy at Oxford, but failed of re-election at the end of that term on account of his advanced religious views. He was again elected to the chair in 1888, however, after the death of Bonamy Price, who had held the post in the interval. In 1880 he entered Parliament for Southwark and in 1885 was elected for Bermondsey; but his adoption of Gladstone's home rule policy in 1886 lost him his seat in the general election of that year. His great work is his 'History of Agriculture and Prices in England' (1866-93), covering the period from 1259 to 1793. Based upon this was his 'Six Centuries of Work and Wages' (1884).

ROGERS, John, English Reformed clergyman, first martyr in the persecution under Queen Mary: b. Deritend, Aston parish, near

Birmingham, about 1500; d. London, 4 Feb. 1555. He obtained his education at Cambridge in 1532-34, was rector of Trinity and Less, London, and then went to Antwerp as chaplain to the English merchants. There, it is said, he was led by William Tindall, then busy on the translation of the Old Testament into English, to change his religious views. He then took charge of a Protestant congregation at Wittenberg, and prepared for the press an English rendering of the Bible, including Tindall's New Testament, and Old Testament as far as the end of 2 Chronicles. His part in the translation was slight, but his marginal notes formed the earliest English commentary on the Scriptures. The whole constituted the second complete version in English, Coverdale's having appeared in 1535, while this appeared, with the pseudonym "Thomas Matthew" on the title-page, in 1537. In 1548 Rogers returned to England, in 1550 was simultaneously made rector of Saint Margaret Moyses, London, and vicar of Saint Sepulchre there. In 1551 he received the prebend of Saint Pancras in Saint Paul's Cathedral. In 1553 he preached twice at Paul's Cross, the second time against Catholicism (6 August), three days after Queen Mary's arrival in London. He was shortly deprived of the emoluments of his benefices, on 27 Jan. 1554, imprisoned at Newgate at the instance of Bonner, new bishop of London, and after two examinations (22, 29 January), was burned at the stake at Smithfield; showing, says Fox, "most constant patience, . . . exhorting the people constantly to remain in that faith and true doctrine which he before had taught." Consult Fox, 'Book of Martyrs'; and the biography by Chester (1861).

ROGERS, John, American sculptor: b. Salem, Mass., 30 Oct. 1829; d. New Canaan, Conn., July 1904. In early life he developed a talent in clay modeling; and in 1858 went to Europe where he studied under the best masters in Paris and Rome. He returned to the United States in 1859, and modeled a large number of statuettes, of which his first group, 'The Checker Players,' attracted popular attention. Many of these "Rogers Groups" pertained to the Civil War and elicited general popular approval rather than the unstinted admiration of the art critic. He also executed the equestrian statue of General Reynolds, now at the city hall in Philadelphia.

ROGERS, Randolph, American sculptor: b. Waterloo, N. Y., 6 July 1825; d. 15 Jan. 1892. He studied art in Europe from 1848 to 1850 when he returned to the United States, where he executed a statue of Bulwer's blind heroine 'Nydia' and a figure of President John Adams. He for five years had a studio in New York, but established himself in Rome in 1855. In 1858 he began the bronze doors for the capitol at Washington and subsequently executed several portrait statues and memorial monuments in Providence, Richmond, Detroit and other cities. His colossal figures of Generals Lewis and Nelson, for the Washington monument, which Crawford had begun to raise near Richmond, are good specimens of his work. Among his other statues is that of Seward in Madison Square Park, New York. Perhaps one of his best works is the figure of the 'Resurrection

Angel' for the tomb of Colonel Colt in Hartford, Conn.

ROGERS, Robert, American author and soldier: b. Dunbarton, N. H., 1727; d. London, England, 18 May 1795. He raised a company of soldiers known as "Rogers' Rangers" and commanded them efficiently during the French and Indian War of 1755-63. He visited England in 1765 and was appointed governor of Mackinaw, Mich., but while holding this office was charged with designs for delivering his own fort to the French and was sent to Montreal in irons. At the outbreak of the American Revolution he declined a commission in the Colonial army, though professing a sincere interest in the cause of the colonies, and later aroused the suspicions of Washington. He was secured but was released on parole, which he broke, accepted a commission in the British army and organized the "Queen's Rangers," recruits to which he promised their "proportion of rebel lands." Shortly after 1776 he went to England. He was proscribed and banished by the provincial government of New Hampshire in 1778. He wrote 'A Concise Account of North America' (1765); 'Ponteach, or the Savages of America,' a tragedy in verse, now very rare (1766); and 'A Diary of the Siege of Detroit in the War with Pontiac,' first published in 1860.

ROGERS, Robert Cameron, American poet: b. Buffalo, N. Y., 7 Jan. 1862. He was graduated from Yale in 1883, and has since published 'Wind in the Clearing and Other Poems'; 'For the King and Other Poems'; and in prose, 'Will o' the Wisp,' a sea tale; and 'Old Dorset: Chronicles of a New York Country Side.'

ROGERS, Robert Williams, American Orientalist: b. Philadelphia, Pa., 1864. He was graduated at the University of Pennsylvania in 1886, and later studied at Johns Hopkins, Haverford and Leipzig. He was professor of the English Bible and Semitic history at Dickinson College in 1890-92; and since 1893 he has been professor of Hebrew and Old Testament Exegesis at Drew Theological Seminary. He has also been an extension professor of Columbia since 1917. Author of 'Two Texts of Esarhaddon' (1889); 'Inscriptions of Sennacherib' (1893); 'History of Babylonia and Assyria' (2 vols., 1900); 'Cuneiform Parallels to the Old Testament' (1912); 'The Recovery of the Ancient Orient' (1912), etc.

ROGERS, Samuel, English poet: b. Stoke-Newington, London, 30 July 1763; d. London, 18 Dec. 1855. After attendance at private school he entered the Rogers banking establishment as a clerk, but his favorite pursuits were poetry and general literature. In 1786 he printed anonymously 'An Ode to Superstition, with Some Other Poems.' His 'Pleasures of Memory,' with which his name is principally identified, appeared in 1792. It is a carefully finished, graceful production, but somewhat deficient in force and vigor, and though everyone is familiar with the name, the 'Pleasures of Memory' is a poem that at the present day is comparatively little read. It was received with unbounded applause, while the reputation of the author was still further confirmed by the publication in 1798 of 'An Epistle to a Friend and other Poems.' He now built the celebrated

house in Saint James' street, Westminster, long made the centre of intellectual society, which he had in part decorated by Stothard and Flaxman and which was filled with antiques, books and art-works, all selected in admirable taste. It ought also to be recorded that, though of great brusqueness and bitter of tongue, no man was more generous in relieving distress or assisting struggling genius; and Sheridan, Moore, Campbell and others were all indebted at different times to his generosity. He published in 1810 his poem 'Columbus,' which was severely handled by the *Quarterly Review* and met with little success. 'Jacqueline, a Tale,' appeared in 1814, in the same volume with Lord Byron's 'Lara.' The same year he visited Paris, extending his tour to Italy and remaining abroad for several years. On his return in 1819 he published the poem 'Human Life,' and in 1822 appeared the first part of his 'Italy,' a series of poems descriptive of the scenery and antiquities of that country, and perhaps the finest of all his works. Continuations of it followed at successive intervals and a complete edition in 1830, beautifully illustrated by Prout, Stothard and Turner, which, with an illustrated edition of his other poems, composes two octavo volumes, was issued at a large expense to the author. It proved, however, a remunerative speculation. In 1850 Rogers was offered the laureateship vacated by the death of Wordsworth, but declined the appointment, which was bestowed on Tennyson. His unique collection of works of art was disposed of by auction after his death. Rogers' long life saw many literary changes, from the times of Goldsmith and Johnson to those of Thackeray and Dickens. He was a kind of English "autocrat of the breakfast table," famous for his anecdotes and bon-mots, and his discussions of politics and art. He was certainly a representative, though among the less prominent, of a brilliant period of English poetry, with him care and taste serving for genius. A volume of his 'Table Talk' was published by Alexander Dyce (1860). Consult Clayden, 'Early Life of Samuel Rogers' (1887) and 'Rogers and His Contemporaries' (1889). The correspondence, journals and memoirs of the earlier 19th century abound in references to him.

ROGERS, William, English clergyman and educational reformer: b. London, 24 Nov. 1819; d. there, 19 Jan. 1896. He was educated at Baliol College, Oxford, and at Durham University and was ordained in the Anglican Church in 1843. He was appointed perpetual curate at Saint Thomas Charterhouse in 1845 and labored in that district for 18 years, establishing schools for the poor and greatly ameliorating the condition of the poor generally. He was a member of the commission to inquire into popular education in 1858 and in 1870 became a member of the London school board. He was appointed chaplain in ordinary to the queen in 1857 and rector of Saint Botolph's, Bishopgate, in 1863. He continued a zealous worker for the establishment of schools and his determined stand for their secular standing earned for him the sobriquet of "Hang-theology Rogers" through his impatience at the objection made to "godless education." He secured the erection of the Cowper street schools and the completion of Bishopgate In-

stitute crowned his lifework. Consult his 'Reminiscences' (London 1888).

ROGERS, William Augustus, American astronomer: b. Waterford, Conn., 13 Nov. 1832; d. Waterville, Me., 1 March 1898. He was graduated from Brown University in 1857, engaged in teaching at Alfred University and in 1858 accepted its chair of mathematics and astronomy. In 1864-65 he served in the United States navy and in 1866-67 studied at Yale, but resumed his duties at Alfred after each interruption and under his direction the observatory there was built and equipped. He was appointed assistant at the Harvard Observatory in 1870 and became assistant professor of astronomy in 1877. He accepted the chair of astronomy and physics at Colby University in 1886 and remained there until his death. His work at Harvard Observatory consisted of observing and mapping all the stars down to the ninth magnitude, in a narrow belt a trifle north of our zenith, a task which consumed 11 years in observations and 15 years for their reductions. He overcame the difficulty of finding micrometer spiderwebs suitable for his work by etching glass plates with hydrofluoric acid, an expedient which proved so successful that he furnished the government with the plates used by the expedition to observe the transit of Venus. He was an acknowledged authority in the micrometrical field and established standards of measurement for practical mechanical work. He was an active member of various scientific societies and published nearly 70 papers concerning his specialties. He also published, in the 'Annals of Harvard Observatory,' 'Observations Made with Meridian Circle, 1871-72'; 'Catalogue of 8,627 Stars between 49° 50' and 50° 10' of North Declination, 1875'; 'Journal of Zone Observations During the Years 1875-1883,' etc.

ROGERS, William Barton, American geologist and physicist: b. Philadelphia, 7 Dec. 1804; d. Boston, 30 May 1882. He was educated at William and Mary College, gave scientific lectures before the Maryland Institute in 1827 and in 1828 became professor of natural philosophy and chemistry in his alma mater. From 1835 until his resignation in 1853 he was professor of natural philosophy in the University of Virginia. He added to the course mineralogy and geology; and organized and directed the Virginia geological survey until its discontinuance in 1842. During his occupancy of this chair he devoted much of his time to original researches in geology, chemistry and physics. He was also a leading member of the Association of American Geologists and Naturalists (organized 1840), and to its *Transactions* contributed important memoirs, including observations on the temperature of coal mines in eastern Virginia. In 1853 he removed to Boston, where he continued his researches and voluminous contributions to scientific journals of the United States and Europe, and in 1862 lectured before the Lowell Institute on "The Application of Science to the Arts." At the request of several citizens of Boston, he drew up in 1859 a scheme entitled "Object and Plan of an Institute of Technology," to include a society of arts, a museum of arts and a school of industrial science. He then memorialized the State legislature and at length obtained from

the State a charter (1862), and the grant of a tract in the Back Bay district upon which to place the buildings of the institution. Chosen the first president of the Massachusetts Institute of Technology, he was made also professor of physics and geology and in 1864 visited Europe for the purchase of scientific instruments and appliances. He organized the system of teaching which still in general obtains in the Institute and whose leading feature was laboratory instruction not only in chemistry, but in physics, mechanics and mining. He resigned his post as president in 1870, but resumed his duties from 1878 to 1881, when he was succeeded by Francis A. Walker (q.v.). In 1847 he presided at the meeting by which the Association of American Geologists and Naturalists was enlarged into the American Association for the Advancement of Science; was made president of the latter in 1875; was a corporate member of the National Academy of Sciences; became its president in 1878; and was a founder and the first president of the American Social Science Association. He has been characterized as one who had in a high degree "the faculty of presenting the claims of science on popular interest and respect with force and lucidity." His gifts of expression as speaker and writer were excellent. Many of his researches added materially to scientific knowledge. Among his books were 'The Strength of Materials' (1838); 'The Elements of Mechanical Philosophy' (1852); and 'Papers on the Geology of Virginia' (1884), comprising his yearly reports in 1836-40. Consult the 'Life and Letters,' published in 1897.

ROGERS, Ark., town of Benton County, 90 miles north of Fort Smith, on the Kansas City and Memphis and the Saint Louis and San Francisco railroads. The town has flour mills, lime works, vinegar and pickling plant and a hub and spoke factory. Pop. 2,820.

ROGERSVILLE, rōj'ēr-z-vīl, Tenn., village, county-seat of Hawkins County, on the Southern Railroad, about 45 miles east-northeast of Knoxville. It is in a fertile valley, bordered by mountainous regions rich in variegated marble and building stone and considerable coal. The chief manufacturing establishments are flour mills, furniture factories and machine shops. A number of the villagers have employment in the marble quarries. The educational institutions are the McMinn Military Academy and the Swift Memorial Institute. The latter was founded in 1848 by the Presbyterian Church. There are good public schools and two school libraries. The national bank has a capital of \$75,000. Pop. 1,582.

ROGERSVILLE, Engagements at. On 5 Nov. 1863 Col. Israel Garrard, with the 7th Ohio Cavalry, 2d Tennessee mounted infantry, and a battery of four guns, occupied Rogersville, Tenn., camping near the town. During the day Gen. W. E. Jones, with about 2,500 Confederate cavalry, crossed the Holston River near Kingsport, made a night march by roads badly guarded and at daybreak of the 6th surprised and captured Garrard's outposts, and advanced toward his camp, attacking and routing the 7th Ohio, Garrard and a few of his men escaping to Morristown. Jones then attacked the Tennessee regiment, which made a good resistance, but was soon surrounded and obliged to surrender. The Union loss was about 20

killed and wounded, with 650 men, four guns, two colors, 1,000 horses and mules and 40 wagons and ambulances captured. The Confederate loss, as reported, was 10 killed and wounded. News of the disaster caused a hasty retreat of the Union forces from Jonesboro and Greenville to Bull's Gap, where it was learned that Jones had not advanced beyond Rogersville and the retreat ended. At the same time Jones retreated in an opposite direction to the Virginia line.

On 21 Aug. 1864 Rogersville was held by a small force of Confederate cavalry, under Colonel Watkins, which was attacked at daybreak by a detachment of the 13th Tennessee cavalry, under Lieutenant-Colonel Ingerton. Several Confederates were killed and wounded and Watkins, with 25 of his men, captured, the remainder escaping to Kingsport. On 8 Oct. 1864 Gen. John C. Vaughn, having driven a Union force from Kingsport, followed it to Rogersville and attacked with his brigade, killing 10 and wounding several Union troops and driving the remainder to Bull's Gap. On 10 December Gen. A. C. Gillem, with a Union brigade, marched from Knoxville, on the 12th drove in the pickets of General Duke's brigade, and followed to Big Creek, four miles from Rogersville, where the Confederates had taken a strong position. With a part of his command Gillem made a flank movement, charged with the other part and drove the Confederates from position and through Rogersville, in the direction of Kingsport, where they were overtaken next day and routed, with some loss. Consult 'Official Records,' Vols. XXXI, XXXIX and XLV. E. A. CARMAN.

ROGET, rō-zhā', Peter Mark, English physician: b. London, 18 Jan. 1779; d. Malvern, Worcestershire, 12 Sept. 1869. He was educated at the University of Edinburgh and was appointed physician to the Manchester Infirmary in 1804. In 1808 he removed to London, where he became physician to the Northern Dispensary. He was elected a fellow of the Royal Society in 1815 and for 20 years served as its secretary. He was professor of physiology at the Royal Institute in 1833-36 and in 1837 was active in the establishment of the University of London, in the senate of which he continued a member until his death. He retired from practice in 1840 and devoted himself to literature and to mechanics, for which he had decided talent. He wrote 'Animal and Vegetable Physiology Considered with Reference to Natural Theology' (1834); 'Physiology and Phrenology' (1838); and the famous 'Thesaurus of English Words and Phrases' (1852).

ROGGEVELD (rōg'gē-vēld) **MOUNTAINS**, in Africa, in the southwestern division of Cape Colony, running northwest to southeast with an average height of 5,000 feet. They form a western continuation of the Nieuwveld Mountains.

ROGIER, rō-zhē-ā, Charles Latour, Belgian statesman: b. Saint Quentin, 17 Aug. 1800; d. Brussels, 27 May 1885. He was educated at the University of Liège and at the outbreak of the Belgian revolution in September 1830 became a revolutionary leader in Brussels. On 24 September he was made president of the administrative commission and later went as a delegate of the provisional govern-

ment to Antwerp. After an armistice had been arranged with Holland, he exercised absolute power in the reorganization of the administration of the city. He represented Liège in the National Congress, voted to establish a hereditary monarchy, and proposed the adoption of the elective second chamber. He became governor of the province of Antwerp in 1831 and the next year Minister of the Interior. He retired in 1834 after having carried a law providing for the establishment in Belgium of the first railway in Europe. From 1834 to 1840 he was again governor of Antwerp; and leader of the Liberal party in opposition 1841-47. He became Prime Minister and Minister of the Interior in 1847 and by his energy and foresight Belgium escaped the revolutionary crisis that involved Europe in 1848. In 1850 he organized secondary education under control of the state; but retired from office in 1852. Again becoming Prime Minister in 1857 one of the first acts of his ministry was the fortification of Antwerp. In 1861 he became Minister of Foreign Affairs and succeeded in freeing the navigation of the Scheldt, which fact contributed to make Antwerp one of the important ports of Europe. He retired from ministerial office in 1868, though he sat for Tournai until his death.

ROGUE MONEY, the popular name for an assessment formerly levied on every county in Scotland "for defraying the charges of apprehending criminals or subsisting them when apprehended and of carrying on prosecutions against them." This tax was first imposed by a statute of George I, on the assertion that criminals were in the habit of escaping punishment for lack of the funds necessary to bring them to justice. The freeholders in each shire were directed to fix the assessment at any of the head courts yearly and to appoint collectors. By an act of Victoria rogue money in the shires was abolished and in lieu thereof power was conferred on the commissioners of supply to levy by date a "county general assessment."

ROGUE (rōg) RIVER INDIANS, the name applied to a number of Indian tribes on Rogue River, southwestern Oregon, most of which belonged to the Athapascan stock, but the members of the Takilman stock were also included. They were not friendly to the early settlers, and in 1853, with neighboring tribes, they resented the continued encroachments on their lands by conducting a succession of massacres and outrages which continued until 1856, when they were compelled to submit to American troops and sent to Grande Ronde Reservation. Here they remained until the spring of 1857 when they were finally established on Siletz Reservation. Here, with five other tribes, they now number 453.

ROHAN, Henri dē, dñ-rē dē rō-ān, DUKE OF, French general: b. Castle of Blain, Brittany, 21 Aug. 1579; d. Königsfeld, 13 April 1638. In his 16th year he joined the court of Henry IV, whose childless marriage led him to entertain the hope that, as a very near relative, he might one day succeed him in Navarre, but in 1610 the assassination of the king dashed all his hopes. The opposing parties again flew to arms and Rohan placed himself at the head of the Calvinists. But Louis XIII and Richelieu, the all-powerful minister, annihilated the political ex-

istence of the Huguenots. Rohan then withdrew from his native land, and in exile wrote 'Mémoires sur les choses advenues en France depuis la mort de Henri IV' (1630). In the wars of Venice against Austria he commanded the troops of the republic till the Peace of Cherasco in 1631. Later he went to Geneva, where he composed his 'Mémoires et lettres sur la guerre de la Valteline' (1638). In Germany the Roman Catholic league had made war against the Protestants, and Rohan in 1638 joined Bernard of Weimar, then commanding the Protestant army on the Rhine. He was wounded at the battle of Rheinfelden, 28 Feb. 1638, and his death followed shortly afterward. Besides the works mentioned above he wrote 'De l'intérêt des princes et états de la Chrétienté' (1638).

ROHILKHAND, rō-hīl-kūnd' or -känd', or **ROHILCUND**, India, a division of the United Provinces of Agra and Oudh, bounded north by the Himalayas, separating it from Kumaon, west and southwest by the Ganges, and east and southeast by Oudh; area, 10,885 square miles. The surface is a plain, with a gradual slope south, in which direction its principal streams, Ramganga, Deoha and others flow. Its north frontier is occupied by an extensive forest; elsewhere palms, the sugar-cane, cotton and the finer fruits of the temperate zone flourish. It takes its name from the Rohillas, an Afghan tribe, who gained possession early in the 18th century. The division is subdivided into the districts Bijnur, Muradabad, Budaon, Bareilly, Terai and Shahjahanpur. It encloses the native principality of Rampur. Pop. of division, 5,343,674.

ROHLFS, rōlfs, Anna Katharine Green. See GREEN, ANNA KATHARINE.

ROHLFS, Friedrich Gerhard, German African traveler: b. Vegesack, Germany, 14 April 1831; d. Goderburg, Prussia, 3 June 1896. He was educated at Heidelberg and Göttingen and in 1855-60 served as a surgeon in the French army at Algiers. He traveled through Morocco in 1860 and in 1862 explored the Taflet Oasis. He traveled in North Africa in 1863 and in 1865, joined the English expedition to Abyssinia in 1867 and in 1868 traveled in Cyrenaica. He conducted an expedition through the Libyan Desert in 1873-74, traveled in North America in 1875-76 and in 1878 again visited Africa, penetrating to the Kufra Oasis. He traveled in Abyssinia in 1880 and in 1884-85 acted as German consul at Zanzibar. He wrote 'Journey through Morocco' (1869); 'Across Africa' (1874-75); 'My Mission to Abyssinia' (1883); 'What News from Africa' (1887), etc.

ROJAS, Fernando de, Spaniard, the reputed author of the 'Tragicomedia de Calisto y Melibea,' known also as the 'Celestina.' He flourished during the latter part of the 15th and the first part of the 16th centuries. According to his own confession he wrote the continuation of this very famous work and his addition appeared in 1499. There has been much discussion as to whether he really was the author of the work that he claims as his own. Ticknor and other notable writers on the Spanish literature of the period appear to be willing to take him at his word, while still other critics, like R. Foulché-Delbosc,

have striven to show that he was an impostor. The 'Celestina' is the most dramatic and characteristically Spanish of all works up to the date of its publication. It ran through numerous editions (between 30 and 40) and was immensely popular in its day, not only in Spain, but in France and Italy. Translations of it appeared in French, Latin, Italian, English, German and Dutch. While the work is sparkling with wit and humor and is racy with Spanish idiomatic expressions, customs and descriptions, its grossness is very offensive to modern taste. Yet it was universally read and imitated, not only at the time of its appearance, but for long afterward. It thus came to exercise a very strong and lasting influence upon both the Spanish drama and the Spanish novel. So popular was this work that the name 'Celestina' was on everyone's tongue and it passed into a proverb. Hundreds of the sayings from 'Celestina' passed into current use and are still to be found among the rich and poor, illiterate and educated, alike, throughout Spain. Naturally scores of imitations of it were written, none of them however in any way equal to the original 'Celestina.'

ROJAS Y ZORRILLA, rō'hās ē thōr-rēl'yā Francisco de, Spanish dramatist: b. Toledo, Spain, 4 Oct. 1607; d. about 1648. Information concerning his life is of a fragmentary character and he is frequently confused with several other persons of the same name. He seems to have studied at the universities of Toledo and Salamanca and his work had become famous by 1632, as Montalván mentions him in high terms in his 'Para Todos' of that year. In 1644 he was honored with the mantle of the Order of Santiago, an evidence of favor at court. He was author of numerous plays and sacred pieces, but took no pains to preserve his works and many of them have been lost, though he did publish two 'Parts' of his dramas (1640-45) and announced a third which never appeared. Among the best of his remaining works are 'Del rey abajo ninguno'; 'Entre bobos anda el juego'; 'Lo que son mujeres'; 'Casarse por vengarse.' No complete edition of his remaining works has been published, but an excellent selection is given in Rivadeneyra's 'Biblioteca de autores españoles' (Vol. LIV, 1866).

ROKITANSKY, rō-kē-tān'skē, Karl, BARON von, Bohemian anatomist: b. Königgrätz, 19 Feb. 1804; d. Vienna, 23 July 1878. He studied at Prague and Vienna; became professor of pathological anatomy at the University of Vienna in 1834, and continued there until 1875. His great work, 'Handbuch der pathologischen Anatomie' (1842-46), stands as the foundation of the science of pathological anatomy. It was translated by order of the Sydenham Society in 1849-52. In 1869 Rokitansky became president of the Austrian Academy of Sciences.

ROLAND DE LA PLATIERE, Jean Marie, zhōā mā-rē ro-lan de la plā-tē-ār, French patriot: b. Thizy (Beaujolais), 18 Feb. 1734; d. Rouen, 15 Nov. 1793. From a humble position in the mercantile world, he rose to eminence in the city of Amiens, in which he held the office of inspector of manufactures. His interests, however, were not in trade, and his views upon political economy and the great problems of government brought him into the ranks of the philosophers of his day. In 1780 he married

Manon Jeanne Philipon, whose share in the Revolution was even greater than his own. At the outbreak of the Revolution he joined the Moderate Republican party, during whose brief rule he was made Minister of the Interior. This position he held from March until June 1792, when the Girondists were forced to retire. After the conflict in Paris 10 August, Roland was recalled, but the Jacobin spirit was too strong, and he was forced to flee. Upon hearing of the death of his wife he took his own life. Consult Lamartine, 'Histoire des Girondins' (1847; Eng. trans. by Ryde).

ROLAND DE LA PLATIERE, Manon Jeanne Philipon, wife of Jean Marie Roland (q.v.): b. Paris, 17 March 1754; d. there, 9 Nov. 1793. With a mind bent upon interests far beyond her years from earliest childhood, Mademoiselle Philipon, the daughter of a Paris engraver, developed at 19 remarkable talents, and at 24 into a woman of great brilliancy of intellect, a disciple of Rousseau, the emancipation of the common people her creed, and their deliverers, the philosophers and patriots of France, her friends and counsellors. In 1779 she was married to M. Roland, with whose political fortunes her life was thenceforth bound. Her faith in the outcome of the Revolution was that of a devotee, her enthusiasm the inspiration of a great party. At first the friends and confidants of Robespierre and those who were afterward leaders of the Jacobin element, the Rolands became the defenders of the more moderate republican idea, and were among the greatest martyrs to this cause. On the fall of the Girondists in the summer of 1793, Madame Roland was arrested, and on the 9th of November was guillotined. During her imprisonment she wrote her famous 'Mémoires,' which were afterward published, together with her correspondence with the other leaders of the French Revolution. Consult Lamartine, 'Histoire des Girondins,' English translation by Ryde (1849); 'Correspondence de Madame Roland,' edited by C. Perroud (1901); Tarbell, 'Life of Madame Roland' (1896).

ROLAND, rō'land (Italian ORLANDO), hero of romance and one of the paladins of Charlemagne, whose nephew he was reputed to be. His character is that of a brave, unsuspicious and loyal warrior, but somewhat simple in his disposition. The poems of Pulci, 'Morgante Maggiore'; of Boiardo, 'Orlando Innamorato'; and Ariosto, 'Orlando Furioso,' relate to Roland and his exploits. (See CHANSON DE ROLAND; MORGANTE MAGGIORE; ORLANDO FURIOSO; ORLANDO INNAMORATO; ROLAND SONG, THE; ROLANDSLIED). Consult Einhard, 'Vita Caroli Magni'; Turpin, 'De Vita Caroli Magni et Rolandi'; Schmidt, 'Ueber die italienschen Heldengeschichten aus dem Sagenkreis Karls des Grossen' (1820).

ROLAND SONG, The ('La Chanson de Roland') is the chief French chivalrous epic and almost the oldest to survive. Written before 1080, the creation of a single minstrel who was a true poet, it bears internal evidence of a legendary ancestry stretching back almost to the days of Charlemagne. In 778 that still youthful king made an incursion into Spain and was checked at Saragossa. On his return across the Pyrenees his rear guard was attacked

by Basque mountaineers at Roncesvalles and exterminated. Among the dead was Hrodland, Count of Brittany. Breton minstrels were quick to exploit the tragic theme. Roland's fame spread quickly over all France and beyond. In the 11th century his tomb was shown at Blaie, his horn, cracked, at Bordeaux. A minstrel sang of him to the Normans at Hastings in 1066. Forms of the legend earlier than the 'Chanson' can be discerned in a prose chronicle attributed to 'Archbishop Turpin' and in the Latin 'Carmen de proditiōne Guenonis' ('Song of the Treason of Ganelon'). The minstrel of the 'Chanson' introduced many new elements and infused the whole with a nationalizing fervor of patriotic inspiration. The 'Chanson' is preserved only in manuscript written a century after its composition by scribes who were unfamiliar with its language and did some violence to its versification. In the oldest of them it counts 4,002 verses. This was discovered at Oxford by F. Michel and edited by him in 1837 and since often, most elaborately by Léon Gautier in more than 20 editions. Its French shows strong marks of Breton influence and occasionally suggests an effort to combine, without fusing, differing versions of the original. In this form of the legend the Basque mountaineers have become Saracen "barons," who worship images of Mahomet and Apollo, are able to muster for an ambush 400,000 men in three days and to summon almost equal reinforcements from Babylon and its Ethiopian vassals who seek in vain to cope with the remnant of Roland's 20,000 rear guard. Roland's jealous stepfather, Ganelon, betrays the French to the "pagans." King Charles, then 35, is for the poet 200 years old, "conqueror of England, Germany, Bavaria, Lorraine, Burgundy, Italy, Brittany and other regions and cities innumerable." His 12 paladins match the knights of Arthur's Round Table. Roland, the king's nephew, leads them in valor, Oliver in counsel. Archbishop Turpin is their guide in religion, promising paradise to those who die killing Saracens, and bidding them "for penance, hit hard" (line 1138). Prodiges of valor and slaughter pall by iteration but there are many scenes to stir generous blood still, notably where Roland, counselled by Oliver, scorns in proud self-confidence to summon the king to his aid and, when he blows the horn in the last desperate strait, dies, still unscathed, his veins burst by the strain of the supreme call. Very striking, too, is the death of Aude, Roland's betrothed, and the trial of Ganelon. At the end Charles, divinely summoned to new conquests, exclaims, as he plucks his mighty beard, "My God, how toilsome is my life" (line 4001).

The 'Chanson' is framed in *liasses*, strophes of about 15 lines, with assonant endings. The style is vivid, concise, direct. There is but one simile in the whole poem. Its grandeur is in its ideal of devotion, fidelity, courage and honor, its impassioned patriotism and its expression of a spirit of national unity till then unknown to Europe's Middle Age. Its vogue was immediate and wide. It was soon put into French rhymes and adapted to most varied foreign taste in English, Dutch, Danish, German, Norwegian, Spanish, Portuguese and Italian versions. It has been translated into

modern French by Petit de Julleville (Paris: 1878) and others; into English prose by I. Butler (Boston 1904) and, partially, into verse by Way and Spencer (London 1895). Consult Paris, G., 'Histoire poétique de Charlemagne' (Paris 1905) and 'Légendes du moyen âge' (Paris 1903); also Gautier, L., 'Bibliographie des chansons de geste' (Paris 1897).

BENJAMIN W. WELLS.

ROLANDSLIED, the 'Song of Roland,' the name of several mediæval German versions of the French 'Chanson de Roland' (q.v.). The first was probably made by Pfafe Konrad in 1131-33, in the service of Henry the Proud; it was called 'Ruolandes liet,' and served as a basis for at least two later versions by other German poets. One was written by a Lower Rhenish poet toward the end of the 12th century, the other by an Austrian poet, called Der Stricker, in the first half of the 13th century; he probably supplemented the older version by using later French poems for additional data. None of the versions produced in any country attain the popular importance, however, of the later Italian Roland poems: Pulci's 'Morgante Maggiore,' Boiardo's 'Orlando Innamorato,' Ariosto's 'Orlando Furioso.' A German poet, Immermann (q.v.) used the episode of Roland's death as the subject for a tragedy, 'Das Tal von Ronceval' (Hamm 1822). Consult Ammann, 'Das Verhältnis von Strickers Karl zum Roland des Pfaffen Konrad, mit Berücksichtigung des Chanson de Roland' (Vienna 1902); Bartsch, 'Über Karlmeinet' (Nürnberg 1861).

ROLFE, John, English colonist in America: b. England, about 1585; d. Virginia, 1623. He settled in Virginia in 1610, his wife dying soon after his arrival. He became one of the leading settlers in the colony, and introduced the regular cultivation of tobacco. He was married to Pocahontas (q.v.) in 1613 and took her to England in 1616. After the death of Pocahontas in 1617 he returned to Virginia, was married to an Englishwoman and left several children. He had one son by his marriage with Pocahontas.

ROLFE, John Carew, American educator: b. Lawrence, Mass., 15 Oct. 1859. He was graduated at Harvard in 1881, and later studied at Cornell and at the American School, Athens. He was instructor in Latin at Cornell in 1882-85, and in Latin and Greek at Harvard in 1889-90. He became associated with the staff of the University of Michigan in 1890, and was professor of Latin there in 1894-1902. Since 1902 he has been professor of Latin language and literature at the University of Pennsylvania. In 1907-08 he was professor at the American School of Classical Studies at Rome. He edited many textbooks.

ROLFE, William James, American Shakespearean scholar: b. Newburyport, Mass., 10 Dec. 1827; d. 7 July 1910. He was educated at Amherst, and after teaching in Wrentham, Mass., became master of the high school, Dorchester, Mass., in 1852. In 1857 he occupied a similar post in the high school at Lawrence, Mass., in 1861 at Salem, Mass., and from 1866 to 1868 at Cambridge, Mass., resigning in 1868 to devote himself to literary pursuits. His Shakespearean labors began in 1867 with his editorship (with J. H. Hanson) of Craik's

'English of Shakespeare.' In 1870 he issued an annotated edition of 'The Merchant of Venice' and followed this with other annotated plays till in 1883 a complete edition of Shakespeare had appeared in 40 volumes. This is sometimes styled 'The Friendly Edition,' a name first suggested by Mary Cowden-Clarke (q.v.). He has also edited 'Select Poems of Goldsmith' (1875); Gray (1876); Browning (1887); and Wordsworth (1889); a complete edition of Scott (1887); and of Tennyson (1895-98), and other works, and in the author of 'Satchel Guide to Europe,' revised yearly (1872-1903); 'Shakespeare the Boy' (1896); 'Life of Shakespeare' (1901). He lectured much upon Shakespeare and literature in general and in his editions of Shakespeare and other poets he admirably preserved the balance between textual and literary criticism.

ROLL, Alfred Philippe, French painter: b. Paris, 10 March 1846. From being a designer of patterns and decorations of various sorts he passed to the Ecole des Beaux Arts at Paris, where he was much attracted to the work of Jerome and Bonnat. The influence of both these teachers is traceable in his pictures, especially that of Bonnat in the duskiness of coloring in his 'Scenes from the Flood at Toulouse in June 1877,' a picture which gained a medal of the first class and is now in the Havre Museum. In succeeding pictures he developed a passion for naturalism of the most uncompromising character, and in his 'Feast of Silenus' (1878) in the museum of Ghent, and still more in the 'Strike of the Colliers' (1880), now in the gallery of Valenciennes, and 'Labor' (a representation of masons, bricklayers, and carpenters at work on a building), this tendency is conspicuous. These are all blazing sunlight pictures, as if executed *en plein air*; his subsequent works, whether portraits, genre-groups, landscapes or marines, are in like style. They are solidly painted with a matter-of-fact air of reality which is very striking. Among his later works is a canvas crowded with figures, 'The Centennial Jubilee of the Revolution of 1789' (1893).

ROLLA, Alessandro, Italian violinist and composer: b. Pavia, 22 April 1757; d. Milan, 15 Sept. 1841. He was active for many years as musical director at La Scala Theatre and teacher in the conservatory in Milan. He published several quartet and solo pieces both for the violin and the bass viol, which for essential purity of composition and perfection of form stand pre-eminently superior to similar works of his day.

ROLLA, rô'la, Mo., city, county-seat of Phelps County, on the Saint Louis and Santa Fé Railroad, about 48 miles south-southeast of Jefferson City and 110 miles southwest of Saint Louis. It is in an agricultural and iron mining region. Its chief industrial establishments are smelting furnaces, foundries, machine shops, flour and grist mills. It is the seat of the Missouri School of Mines and Metallurgy, a department of the Missouri State University (q.v.), organized in 1871. Pop. 1,791.

ROLLAND, rô'lan, Romaine, French author: b. Clamecy, 29 Jan. 1866. He studied at the Ecole Normale Supérieure, Paris, and in 1889-91 was a member of the Ecole Française

de Rome. He was for a time professor of the history of art at the Ecole Normale Supérieure, and was later called to the chair of history and music at the Sorbonne. He was awarded one-fourth of the Nobel Prize for literature in 1915 for the completion of his 'Jean Christophe,' a species of rambling novel, written in 10 volumes and carrying much philosophic discussion of life, the sub-titles being 'L'Aube'; 'Le Matin'; 'L'Adolescent'; 'La Révolte'; 'La Toire sur la place'; 'Antoinette'; 'Dans la Maison'; 'Les amies'; 'Le Buisson Ardent'; and 'Le Nouvelle Journée.' It was translated into English by Cannan, G. (1911-13). His other works include 'Les origines du théâtre lyrique moderne'; 'Les Loups,' drama; 'Le Temps,' drama; 'Vie de Michel Augé'; 'Vie de Beethoven'; 'Haendel'; 'Vie de Tolstoi,' etc. Consult Stephens, W., 'French Novelists of To-day, Second Series' (1915).

ROLLE DE HAMPOLE, rôl dē hām'pôl, Richard, English author and recluse: b. Thornton, near Pickering, Yorkshire, about 1290; d. Hampole, near Doncaster, 25 Sept. 1349. He studied at Oxford and at 19 decided to lead a hermit's life. For many years he was a wanderer, leading a holy life devoted to contemplation rather than to making converts, although he occasionally preached. In his later years he became an inmate of the Cistercian nunnery of Saint Mary, near Doncaster, where he died. His life of unquestionable piety, his adherence to the spiritual side of religion and his exalted love of Christ gave him a wide influence over his generation and that succeeding him. He wrote extensively both in English and in Latin, and many of his manuscripts are preserved. 'The Pricks of Conscience' is a religious poem of 9,624 lines in rhyming couplets and was widely popular; this and his 'Commentary on the Psalter' constitute his most important works. Of his Latin treatises 'De Emendatione Vitæ' and 'De Incendio Amoris' were translated by Richard Misyn (1434-35) and edited by R. Harvey for the Early English Text Society (1896). 'De incendio amoris' is most interesting because of its autobiographical nature. There is no complete edition of his works but an excellent collection is that of Horstmann, C., 'Yorkshire Writers: Richard Rolle of Hampole' (2 vols., 1895-96).

ROLLER, a tropical bird of the genus *Coracias*, forming the type of the family *Coraciidae*. These birds are generally of small size, frequently exhibit brilliant colors in their plumage and are confined to the eastern hemisphere. Their food consists partly of insects and partly of nuts and fruits. The common roller (*Coracias garrula*) is found in Africa, whence it migrates in summer into Europe. In size the roller equals the common jay. The back is of a light brown color. The head is bluish-green, as also are the neck and lower surfaces. The lesser coverts of the wings are bright blue; the tail feathers blue, with a greenish lustre. The voice is noisy and harsh. In habits these birds are shy, and frequent forest depths and secluded spots. The four pure white eggs are frequently deposited in the holes of trees or in holes in river banks. The genus *Eurystomus* is nearly similar to *Coracias*, but

occupies tropical Africa. Both genera include several distinct species. Consult Evans, 'Birds' (1900).

ROLLER BEARING, a bearing in a machine that utilizes hardened steel rollers to reduce friction, as the Hyatt. See **BEARINGS**, **ANTI-FRICTION**.

ROLLER SKATE, a skate patented in France as early as 1819. Since that time scarcely a year has passed without the recording of some improvement in wheel skates. Plimpton's improvement consisted in so gearing two pairs of wheels that they would "cramp" when the footplate was canted to either side, and thus cause the skate to move on a curved line. Several years elapsed before the value of the invention was generally recognized; but in the meantime the inventor was busy making improvements and taking out other patents and in 1874 had brought the skate practically to its present condition. This device of "cramping" the wheels secured the initial success of roller skating. The earlier inventions were crude affairs compared with the modern; the present roller skate combines strength, lightness and ease of action in a marked degree. About 1864 the mania for roller skating appeared in Austria; and in 1866 the "rinking" fever broke out in Australia and spread thence to England and the United States. Since that time the craze has appeared at intervals only to die out again. The most recent form of the roller skate has only two wheels, set one behind the other, resembling the ice skate in its form and action.

ROLLISTON, Thomas William Hazen, Irish author and journalist; b. Glasshouse Shinrone, King's County, 1857. He was educated at Trinity College, Dublin, and lived in Germany in 1879-83. He edited the *Dublin University Review* in 1885-86; was Taylorian lecturer at Oxford University in 1892; and was managing director and secretary of the Irish Industries Association in 1894-97. In 1898-1900 he was leader writer for the *Dublin Daily Express*, as well as Dublin correspondent of the *London Daily Chronicle*. He organized lectures and other educational work under the Department of Agricultural and Technical Instruction for Ireland in 1900-05; and was actively interested in the Irish Literary Revival. Author of 'The Encheiridion of Epictetus' (trans. with introduction and notes, 1881); 'Life of Lessing' (1889); 'Treasury of Irish Poetry,' coeditor (1900); 'Imagination and Art in Gaelic Literature' (1900); 'Sea Spray,' poems (1909); 'Myths and Legends of the Celtic Race' (1911); 'Sacred and Profane Love; a Trilogy after Richard Wagner' (1914); 'Ireland and Poland; a Comparison' (1917), etc.

ROLLIN, rô-lân, Ambrose Lucien, West Indian historian; b. Trois Rivières, Guadeloupe, 1692; d. Point à Pitre, Guadeloupe, 1749. He was appointed deputy-lieutenant of the colony in 1725, an office which he occupied until his death, devoting himself in his leisure to researches upon the Caribes and other Indian tribes. His works show remarkable care and ability and are still accepted as authoritative. They include 'Histoire des Indiens' (1739); 'Histoire et description des Caraïbes, leur con-

dition avant la conquête' (1734); 'Les Incas du Pérou et la conquête Espagnole' (1748), etc.

ROLLIN, Charles, French historian; b. Paris, 30 Jan. 1661; d. there, 14 Sept. 1741. He studied theology at the Sorbonne, but did not take orders. In 1688 he obtained the chair of eloquence in the Collège de France, of which he became rector in 1694, and he there revived the study of the Greek language. In 1696 he was chosen coadjutor or head of the Collège de Beauvais. Displaced in consequence of his connection with the Jansenists, he was reinstated in 1720. His productions are 'Traité des études' (1726-31); 'Histoire ancienne' (1730 and 1738), his best-known work; and 'Histoire romaine' (1738-48) down to the war against the Cimbri (completed by Crevier and others). Rollin's writings are distinguished for purity and elegance of style, but are diffuse and prolix, and his historical works are deficient in critical sagacity. There is an edition of his works in 30 volumes (1827), with notes on the historical parts by Guizot. His 'Ancient History' has been often reprinted in English, but is now quite out of date.

ROLLIN, Ledru. See **LEDRU-ROLLIN**.

ROLLING MILLS are machines employed to convert masses of metal into bars, plates and commercial shapes. They consist of rolls in pairs, driven in opposite directions at nearly the same surface speed, and variously grooved and molded, between which the metal is passed while hot. In successive rollings by passing through a series of openings between the rolls known as "passes," the metal suffers gradual reduction in thickness and a consequent increase in length or breadth, or both, as the case may be. For example, a 15-inch square ingot is reduced to eight inches square by from 12 to 15 passes through the rolls. In very powerful mills such a reduction is sometimes achieved in six or seven passes. See Fig. 1.

The rolls, which are the vital part of the rolling mill, are made of cast steel or a tough cast iron, depending upon the product the mill turns out. For plates and sheets cast iron is used in many mills, the surface of the rolls being "chilled," rendering them very dense and hard, and capable of a high polish which is imparted to the sheets. If the rolls are unusually long, for making large sheets, they are of forged steel. Steel rolls have an advantage in that their deflection under a given load is only about half as much as with cast iron; they are practically unbreakable; and they hold their corners better against crumbling under the pressure. On the other hand, steel rolls cannot be chilled; their temper is soon removed by the heat of the material passing through them; and they are apt to develop a roughness of the surface, and their corners soon lose their sharpness. In proportioning a roll for heavy work it is the rule to make the length not more than twice the smallest diameter at the deepest groove. It is not uncommon to find rolls for light work up to four times the smallest diameter. The roll is formed so as to have a journal at each end, and this is regularly half the diameter of the body of the roll. The outer extremities of the journal are formed into cross-shaped "wobblers" by which they are driven. As used in the various mills rolls are arranged according to one of two general

plans: as "balanced rolls" where the axis of one pair is movable, so as to allow of its being brought closer to the other or vice-versa; and the fixed rolls, whose axes are set in place permanently. In the former type the reduction of an ingot is accomplished by changing the distance between the rolls each time the metal passes; in the second the gradual reduction is made by running the ingot through a series of passes, each smaller than the preceding. The rolls are held in position by housings or frames of great strength, and of such construction that a broken roll may be quickly removed and a new one put in place.

Rolling mills are of four principal designs: (1) the "two-high pull-over" mill, in which there are two rolls set one above the other, the bar being rolled in the passes between the rolls as it goes forward, and is then passed back to its first position over the top roll, to receive its second reduction as it again goes forward—work being done on the bar only on the forward trip; (2) the "two-high reversing" mill, two rolls high, but the motion reversible, so that after the bar has gone through on its forward trip the motion of the rolls is reversed, and the bar returns to the former position through another pass—work being done on the bar in both its directions of travel; (3) the "three-high" mill, in which there are three rolls, one above another, the bar going forward between the bottom and middle rolls, and returning between the middle and top rolls; (4) the "rocking mill," consisting of two pairs of rolls set in a housing shaped in the sector of a circle in such fashion that the housing may be rocked to and fro, bringing alternately one pair of rolls

FIG. 2.—Rocking Bar Mill.

FIG. 3.—Grey Universal Mill, for I-beams.

FIG. 1.—Two-High Cogging Mill; showing the reducing passes in shading.

and then the other into position. The bar is run through one pair as it goes forward, the mill is rocked back and the bar returns through the other pair, the power working continuously in one direction. See Fig. 2.

The Universal Mill is a type of rolling mill with two horizontal rolls and two vertical rolls designed to turn out a finished product with one rolling. The Grey form of this mill is shown in Fig. 3. The passes are made of such shape

as produce almost any dimensions of a given form. Two stands of rolls are used, one directly behind the other. The first gives the preliminary shaping and the second stand finishes.

The rolling mill establishments consist of a series or "train" of several mills. They are arranged according to the class of product turned out. In the "continuous" mill the sets of rolls are set one beyond another, and the metal being

worked passes continuously in one direction, coming out at the further end of the works in a finished condition. The mills which make small rods and wire usually have their stacks of rolls set side by side in a rank. The bar coming from one pair of rolls is caught by the tongs of a workman and curved into a loop, passing back through the adjacent pair of rolls. Another workman catches it and directs it through the next mill in the rank, and thus the one rod may be passing through three or four pairs of rolls at the same time. This is called a "looping" mill. It is adapted only for work of small dimensions. The general purpose mill or "merchant" mill, as it is called, intended to do rolling or order, is generally a combination of the continuous mill and the loop mill.

Rolling mills are popularly classified by their ultimate product: as the blooming mill (making only the blooms for other mills), billet mill, hoop mill, wire mill, sheet mill, tube mill, etc. The products of rolling mills are of two descriptions, semi-finished and finished. To the first group belong blooms, slabs, billets and bars. To the second class belong rods, bands and hoops, structural shapes and rails, plates, sheets, skelp, nail plates, wheels, axles, tires, etc.

The rolls are driven by powerful steam engines, or by electric motors—the latter form of drive coming more and more into favor except for the heaviest work. In mills which run continuously in one direction the fly-wheel is universally in use to store energy when metal is not actually passing through the rolls. In the reversing type of mill the fly-wheel cannot be used, as the engine must be brought to a full stop and reversed with each pass. For this reason the engines to run reversing mills must be extremely powerful. The advantages of electric drive are: (1) economy due to the rapidity of action and high efficiency of all electric machinery at all loads from the lowest to the maximum; (2) reduced floor space; (3) ease of control; (4) uniform drive with a uniform current; (5) smaller initial cost. The motors are coupled direct to the mill, and the speed can be varied from 190 to 270 revolutions per minute. However, in sheet mills, where the speed is cut down to 30-35 revolutions per minute, direct coupling has been proved entirely satisfactory.

In the manufacture of rails, the ingot of cast metal is placed in the soaking pit and heated to a white heat. It is then taken to the blooming mill and passed through the blooming rolls seven times and reduced to a bar of a section nine inches square and 15 feet long which is subsequently sheared into two or three pieces, according to the length of the desired rail. These pieces called "blooms" are then heated in the bloom furnaces from which they are taken to the rail mill, which consists of a series of grooved rollers arranged in three sets—the roughing rolls, the intermediate rolls and the finishing rolls. These rolls are placed one beyond the other and extend over an interval of about 900 feet. The hot blooms are passed through them successively. Through the roughing mill the bloom is passed five times and reduced approximately to the section of the desired rail. It is then passed through the intermediate rolls five times and brought still closer

to the desired section. It is now placed upon a cooling table for a period of time ranging from 45 to 90 seconds, depending upon the weight per pound of the rail, and then passed through the finishing rolls and brought to the exact section required. After leaving the finishing rolls the rails are cut into lengths of 30 to 60 feet, as required, then passed through the cambering rolls where they receive sufficient camber to ensure of their remaining true and straight when cooled. Rail rolling mills have a capacity of turning out from 7,000 to 8,000 rails per day, requiring about 3,000 tons of metal. See RAILS, MANUFACTURE OF.

The largest rolling mill in the world is that recently completed for the Lukens Iron and Steel Company of Coatesville, Pa. It is 204 inches in width, capable of rolling plates up to 192 inches (16 feet) in width. In pattern it is a four-high mill, the two middle rolls being the working rolls and the top and bottom rolls being merely backing-rolls, running in contact with the working rolls to stiffen them against bending. The working rolls are of a chilled iron 34 inches in diameter and the backing rolls are of cast steel 50 inches in diameter. The mill is of the reversing type and the rolls of the "balanced" order, the screw-down rig being operated by two 150-horse-power motors. The rolls are driven by a 46-inch by 70-inch by 60-inch twin tandem compound condensing steam engine.

The normal production of rolled steel in the United States is best assessed from the output of the year 1914, many of the mills since then having been given over to the making of munitions. In that year the product was 3,500,000 tons of rails; 3,000,000 tons of plates; 3,000,000 tons of sheets; 2,500,000 tons of wire rods; 2,500,000 tons of structural shapes; 1,000,000 tons of skelp; 1,000,000 tons of miscellaneous; 8,000,000 tons of merchant mill products—a grand total of 24,500,000 tons. (See PIPE, MANUFACTURE OF, and WIRE, MANUFACTURE OF). Consult Charnock, G. F., 'Mechanical Technology' (London 1915); Harbord, F. W., and Hall, J. W., 'The Metallurgy of Steel' (2 vols., New York 1916); Kindl, F. H., 'The Rolling Mill Industry' (Cleveland, Ohio, 1913); Association of Iron and Steel Electrical Engineers, 'Proceedings 11th Annual Convention' (Philadelphia 1917).

ROLLINS, rôl'inz, Frank West, American politician: b. Concord, N. H., 24 Feb. 1860. He was graduated from the Massachusetts Institute of Technology in 1881 and later attended the Harvard Law School. After a brief practice of the law he became a banker in Boston. In 1894 he was elected to the New Hampshire senate and in 1898 was elected governor of that State. In this capacity he served two years. The idea of "Old Home Week," established in New Hampshire during his administration, and adopted by many of the other States, originated with Governor Rollins. He has published 'The Ring in the Cliff' (1877); 'Break o' Day Tales' (1895); 'The Lady of the Violets' (1898); 'Old Home Week Speeches' (1900), etc.

ROLLINS COLLEGE, located at Winter Park, Fla.; established in 1885. It is not under direct denominational control, but is closely affiliated with the Congregationalists. It has 1

collegiate and preparatory department, the former conferring the degree of bachelor of arts. It is coeducational and the number of women in attendance usually nearly equals the number of men. The grounds and buildings in 1910 were valued at about \$90,000; the library contained 8,000 volumes; the annual income was over \$60,000. The students numbered 200 in both departments and the faculty 20.

ROLLO, rôl'ô, Norwegian conqueror of Normandy: d. 930. According to tradition he was named "Walking Rolf" (Ganger Rolf), because no steed could carry him. He fought for several years in France and finally made peace in 912, receiving from Charles the Simple for himself and his freebooting followers a tract along the Seine between the Eure and Epte. He became a Christian, was baptised at Rouen and took the title Duke Robert. See **NORMANS**.

ROLPH, John, Canadian politician and physician: b. Thornbury, England, 4 March 1793; d. Toronto, 10 Oct. 1870. He studied law and medicine, emigrated to Canada in 1820 and in 1821 was called to the bar. He engaged in law practice and later also practised medicine. He was elected to the assembly of Upper Canada in 1825; and for a time in 1836 was a member of the executive council. With W. L. Mackenzie he planned the insurrection of 1837 and upon its failure sought safety first in the United States and then in Russia. After the amnesty of 1843 he returned to Canada and in 1845 he was elected to the Canadian Parliament. He retired from politics in 1857. He afterward devoted himself to the practice of medicine and founded the Peoples' School of Medicine, which later became a faculty of the University of Toronto. Consult Dent, J. C., 'Canadian Portrait Gallery' (1880); Lindsey's 'Life and Times of W. L. Mackenzie.'

ROMAGNOSI, rô-man-yo'se, Giovanni Domenico, Italian jurist and philosopher: b. Salso Maggiore, Italy, 13 Dec. 1761; d. Corfu, 8 June 1835. He was educated at Pavia and established himself as an advocate at Trent. He was appointed professor of law at Parma in 1803 and in 1806 went to Milan to assist in preparing a code of penal procedure which was later adopted. A chair of law was established expressly for him at Milan, but after the downfall of Napoleon he lost his position. He continued to lecture until 1817 and in 1818 was tried for treason but acquitted. He subsequently supported himself by giving private lessons and continued in abject poverty until his death. Among his works are 'La genesi del diritto penale' (1791); 'Introduzione allo studio del diritto pubblico universale' (2 vols., 1805), etc. Complete editions of his works were published in 19 volumes (1832-35) and in 15 volumes (1836-45).

ROMAIC LITERATURE. Already some centuries before ancient Greek declined and became extinct there existed a dialect among the common people which gradually replaced the majestic tongue of Hellas. Until about the middle of the 18th century this dialect, out of which grew the Romaic or Neo-Hellenic, degenerated in form and became split up into various other dialects. During the Turkish dominion Greek pride of race was kept alive by dwelling on past glories. With the dawn of

independence efforts were made to revive those glories. Ancient authors were studied, ancient names were given to their children, and literary men endeavored to graft the ancient language on to the modern. In the first newspapers which appeared there began an artificial process of grammatical reconstruction that led to curious and confusing results. Ancient Greek accents and words were intertwined with modern French syntax, and a "literary" dialect arose, a language of books that grew quite distinct from the language of the people. Unfortunately no Greek Chaucer or Dante appeared to crystalize the incongruities and dialects into a fixed language for both the written and the spoken word. But for centuries there had been in continuous use among exiled Greeks a literary language lineally descended from the Byzantines, and which could be read and understood by all educated Greeks. At first limited to a small circle, this literary language gradually made its way during the 19th century as a spoken speech among the people—a speech commonly called Romaic, but a form of Byzantine Greek. Educated Greeks speak in the general dialect except with those to whom some ceremony must be used. For many years the Greeks have been purging their language of Turkish and Italian words, so that newspapers are now written almost in the style of classical writers.

Ptochoprodromos or Prodromos, who flourished about 1150 A.D., is the first Romaic author of whom there is definite record. He left two long Romaic poems addressed to the Emperor Manuel Comnenus. To the early 14th century belongs a metrical 'Chronicle of the Conquest of the Morea.' Folksongs especially composed the most widely cultivated form of literature in the heroic 'Klepht' songs, though their literary quality is not very high (see **KLEPHTS**). Among the mass of Romaic literature that emanated from Greece, Constantinople and the islands of the eastern Mediterranean after 1453, there were but few works of importance, notwithstanding the wide range of historical and theological prose, allegorical and erotic poetry, mystery plays and spiritual hymns. The most celebrated compositions before 1800 are 'Abraham's Sacrifice,' a 16th century mystery play; the chivalric romance, 'Erotocritus,' by Vicentius Cornaro who has been styled the modern Homer; and the gruesome drama 'Erophile,' by Chortakis, adapted from the Italian. A revival of enthusiasm for education and literature occurred in the 18th century; Bucharest and Jassy became centres of Hellenic culture, which later found a seat at the University of Corfu, founded by Lord Guildford in 1808. Rhigas of Velestinos (d. 1798), inspired by the French Revolution, aroused the patriotic ardor of his compatriots for liberty. He wrote the war song, 'On, Sons of the Hellenes!'—which has been called the Greek 'Marseillaise.' Joannes Velaras of Epirus (d. 1823) was a doctor by profession and a writer of satirical fables. With the emancipation of Greece in 1821 several men of genius were connected, notably the brothers Panagiotis and Alexandro Svotsos, and Alexandro Rangabé. The first two heartened the people in the struggle for independence with lofty ideals and in eloquent language. Rangabé (Rangavis), though chiefly remembered as a poet, covered a wider field of literature.

His works comprise songs, hymns, ballads, narrative poems, comedies and tragedies. Adamantios Korais (1748-1833) deserves a high place in Romain literature; he was one of the early reformers in the long-drawn-out controversy over the ancient and the "vulgar" Greek. Dyonisius Solomos (1798-1857) wrote the Greek national anthem, the 'Hymn to Freedom,' and a number of powerful dramatic poems, including one on the death of Byron. Of the later writers Valaoritis of Corcyra (1824-79) is the most notable, both as poet and an artist in his craft. His thoughts are expressed in the language of the peasantry, refined and uplifted. Other celebrated poets are Julius Typaldos (1814-83) and Markoras of Corfu; Demetrios Bikelos, who translated some of Shakespeare's plays; the Anacreontic Christopoulos; Georgios Sotres, a witty and versatile journalist and poet. Among the best colloquial story writers are Palamas, Karkavitsa and Eftaliotis. These have preserved the pure dialect of the people and valuable pictures of modern peasant life. Axiotes and the Cretan Damverges are racy in dialogue when their characters converse, but in their own persons they use a rather stilted and conventional style. Between 1892 and 1900, M. Pallis issued a translation into modern Greek of the first half of the 'Iliad.' Although the form of the modern sentence differs widely from the ancient, yet owing to the simplicity of Homer's style, Pallis keeps surprisingly close to his model. Quite a number of Greek authors compose their works in French, German or English, thus reaching a wider circle of readers.

The struggle between ancient and modern Greek assumed an alarming shape on 21 Nov. 1901 when a meeting of 10,000 people held in the temple of Jupiter at Athens protested against the proposed issue of a translation of the Gospel into the popular language, Romain. The meeting was broken up by troops and some 20 persons were killed or injured. The translation had been made by the queen's order, but the students of the university objected to it on the ground that the original text was sacred and should not be tampered with, and that if the Gospels were promulgated in the kingdom in the dialect spoken there the feeling of Pan-Hellenism might be weakened, as a different dialect was spoken by the Greeks in Turkey.

ROMAIKA (rō-mā'i-kā) **DANCE.** See PYRRHIC DANCE.

ROMAINE, rō-mān', William, English Anglican divine: b. Hartlepool, England, 25 Sept. 1714; d. London, 26 July 1795. He was educated at Oxford, held several small curacies prior to 1748, when he went to London to hold a lectureship at the united parishes of Saint George's, Botolph lane, and Saint Botolph's, Billingsgate. In 1749 he became attached to Saint Dunstan's-in-the-West and the next year became morning preacher at Saint George's, Hanover square. He was a follower of Whitefield, an ardent evangelical and suffered much persecution in and out of the Church for his views and on account of the congregations of the poor that he assembled. As a consequence he lost his appointments and held others but for a brief period until 1764, when he was inducted into Saint Ann's, Blackfriars, and was elected by the parishioners to Saint Andrew of the Wardrobe. This election, though disputed, was confirmed by the Court of Chancery and he held the pulpit until his death. He published 'The Life of Faith' (1763); 'The Walk of Faith' (1771); 'The Triumph of Faith' (1794).

ROMAN, André Bienvenu, American governor: b. Opelousas, La., 5 March 1795; d. New Orleans, La., 26 Jan. 1866. He came of French stock, was graduated at Saint Mary's College, Maryland, in 1815, and became a sugar planter in Saint James' Parish. He was for many years a member of the State legislature, serving as speaker of the lower house for four terms, and in 1826-28 he was also judge of Saint James Parish. He was governor of Louisiana in 1831-35 and in 1839-41; and aided the foundation of Jefferson College and the drainage of the swamps around New Orleans. He was a Whig in politics and opposed disunion, but in the Secession Convention of 1861 voted for secession when the crisis was reached. He was one of a Confederate commission of three to approach the government at Washington to seek a peaceable separation from the Union.

ROMAN DE LA VIOLETTE (Fr. 'Romance of the Violet'), a French poem written by Gerbert Montreuil about 1225-30. It contains about 6,700 rhymed lines and exists in four known manuscript copies of different periods, of which two are in the Bibliothèque Nationale, Paris; one in the Imperial Library, Petrograd; and one in the private collection of J. E. Kerr, New York. Its heroine is the victim of a wager concerning her virtue, but triumphs over slander and proves her innocence. The story is used in 'Roman du Comte de Poitiers'; 'Floire et Jeanne'; in the 'Decameron'; Shakespeare's 'Cymbeline'; Weber's 'Euryanthe,' etc. It was published by Francisque Mihel in 1834. Consult Buffum, D. L., 'Le Roman de la Violette' (1904).

ROMAN NOSE, a Cheyenne Indian who operated along the Kansas border from 1864 to 1868. He was a brave and daring leader of a resourceful nature and much feared on that account. In 1866 the whites began to push into the country of the Cheyenne and a railway was being extended through it. The Cheyenne protested. A meeting or council to hear the protest was held at Fort Ellsworth, Kansas, in which General Palmer and the leaders of the Indians took part. At this council Roman Nose presented the claims of the Cheyenne in a concise and forceful manner. The Cheyenne not only protested against the invasion of their territory but they were determined to defend it. Almost immediately the Indians were upon the warpath under Roman Nose and Black Kettle; and they became a terror to western Kansas all along the line of the Kansas Pacific Railroad. Everywhere the isolated homes of settlers were attacked and the inhabitants massacred. General Sheridan, military commander of the district, organized from among the more daring settlers a band of 52 so-called scouts and placed them under the command of Major Forsyth. On 10 Sept. 1868 they came upon the trail of a large band of Indians whom they later encountered on the 17th at Beecher's Island in the Arikaree Fork of the Republican River. There the whites, finding themselves surrounded and outnumbered 20 to 1, retreated to the island where they defended themselves for eight days without food and without horses, the latter having been killed. Roman Nose planned the attack of the island from one side by 500 warriors while he prepared for a cavalry attack with 500 from the opposite side. This latter he led personally in a wild charge which forded the river, reached the island and rode up to the breastworks of the whites who defended themselves steadily and systematically. At the breastworks Roman Nose fell and the Indians broke and fled. But they reorganized and made two more desperate attacks upon the

island only to be repulsed with still greater slaughter. Finally the siege was broken by the arrival of a part of the 10th cavalry from Fort Wallace, Kansas. Consult Hodge, 'Handbook of American Indians' (Washington 1910); Johnston, H. L., 'Famous Indian Chiefs' (Boston 1909).

ROMAN RELIGION. From the time that the Roman religion appears within the pale of traditional and recorded history it seems to have been constantly and progressively subjected to varying influences, both internal and external, and to have passed through many changes. For this reason different writers have had very different views as to what it really was, according as each took his vantage position at this or that point of its evolution. The religious system of the Roman Empire was distinctly different from that of the Romans when they first appeared in Italy. The long and eventful intervening period of time had as effectively changed the composition of the Roman religion as it had that of the Roman people and Roman society. Therefore, any account of the religious life of Rome should explain these constant changes, reveal their causes and show the effects they had upon Roman society and upon that of all the peoples who came closely and intimately into contact with the Imperial City. Fundamentally the primitive religious ideas of all the Indo-European peoples were quite similar. Even the Roman religion, in the days when Rome was governed by kings and had already begun to evolve complicated rituals and complex myths, still retained a suggestive similarity to that of India. Yet striking though this similarity is the difference between the two religions is just as striking. This is due to the fact that, though the religious beliefs of the two peoples had the same origin, they had continued for centuries to develop independent of one another, after the separation in pre-historical times of the two great branches of the family. In the days of her struggles and later, of her achieved greatness, Rome strongly influenced the people with whom she came in contact, and was, in her turn, influenced by them. These influences extended from the Roman colonies in Spain and Gaul in the West to the Far East. Of these influences the strongest were those of Greece, Egypt and Asia Minor. Out of this constantly acting and reacting religious thought grew an all-pervading mysticism and love of philosophical speculation.

Early Period.—Originally the Roman religion was almost altogether nature worship vivified by a primitive belief in an all-pervading and prevailing animism. Survivals of this faith in the religion of Rome at a later period in her history point indisputably to the fact that the Romans were at one time nomadic and given largely, if not altogether, to hunting and fishing, and that their deities and familiar spirits partook of the nature of these occupations. In their nomadic and hunting days the Roman people built no temples and apparently erected no religious monuments. They worshipped the gods of the chase and other beneficent or feared spirits in the haunts of nature, the sacred groves in the forest, by the sides of flowing streams and on the tops of hills and mountains. The early Roman gods were the personification of the elements of nature. The old

Roman deities and supernatural beings of their nomadic life, the patrons of the chase and the guardian spirits of the mountains, the rivers, the earth, the sky and the upper heavens gradually assumed more definite attributes and became, at the same time, confined to a more restricted atmosphere as the Romans settled down to a sedentary life and became agricultural and later on commercial. But being the first on the scene these earlier gods, for the most part, continued to develop and to assume these new attributes in conformity with the natural growth of the city and the civic progress of its people, developing finally into the chief deities of a highly organized community. This evolution was in the full process of accomplishment when Rome became subject to strong and steadily increasing influences. This development of the primitive Roman deities and the influence of outside religious forces were recognized by the Romans at a later period, when they classified their deities as *di indigentes* and *di novensides* or *novensiles*, that is, the native gods and the foreign or new gods, the latter of whom were introduced from the other tribes of Italy, and at a later period from Greece and other countries with whom Rome had come into intimate political contact. Each of these gods, old and new, had his distinct ritual, place and relationship in national life.

Rome, founded, according to tradition, as a free community, threw her gates open to the oppressed and discontented of the surrounding country. This liberality of thought and attitude on the threshold of her career distinguished her ever afterward and enabled her to assimilate, first, all of Italy, and afterward vast domains outside the Italic Peninsula. The deities and religious customs and practices of all the tribes of Italy of Indo-European origin, which were quite similar, gradually became domesticated in Rome. Naturally as the Roman Empire broadened and became more cosmopolitan, its religious system also became broader and more all-embracing. Having absorbed the deities of the Italic Peninsula, the habit of absorption became, with Rome, all-impelling, and the pantheon of the Imperial City, reaching out its octopus arms in every direction throughout the already wide confines of the rapidly extending Roman domain, and even beyond it, brought new creeds, new deities and new religious philosophies into Rome. Under such conditions as these little or no religious dogma could exist; nor did it. On the contrary, religious Rome was like a vast, all-absorbing sponge drawing into itself all that came within its sphere of action, religious creeds, ideas, customs, philosophies, elaborate theories and mystical speculations, with their corresponding practices, rituals, ceremonies and public celebrations. Thus ecclesiastical Rome became as cosmopolitan and eclectic as the Roman Empire itself. This is but another way of saying, however, that the religious life of the Roman community was constantly shifting as the process of broadening continued.

Evolution of the Gods.—In the early Roman gods, which, as we have already seen, consisted for the most part of guardian deities of hunting, fishing, fighting and all the practical needs of daily life, were the seed germs from which sprang the national state religion

under the early kings and the mighty gods of later imperial Rome, with their magnificent temples, shrines and extensive and highly organized priesthood and other ecclesiastical dignitaries, their close connection with the state and their inseparable partnership with the imperial family. The first temples built in Greece and Rome were suggestive of their origin. They consisted of rows of pillars of wood so erected as to imitate or represent the sacred groves of the forest. Diana, the moon goddess, under one name or another and with somewhat varying attributes, the favorite deity of so many nomadic peoples given to the chase, and in all probability the chief deity of the nomadic Romans, gave place to the earth mother, the producer, the characteristic deity of an agricultural people. The agricultural Romans created a new relationship between the heavens which sent the refreshing and invigorating rains and mist upon the earth and the great earth mother who received them; and they made the sky and the great earth, on account of this relationship, husband and wife, father and mother. But the moon goddess did not thereby lose all her ancient power and glory. She still remained what she had always been, distinctively the patroness of the hunters and of all persons taking long journeys. Connected from early times with the primitive priests she continued to be intimately connected with the diviners and soothsayers, and later on, with the alchemists and astrologers, their first cousins.

In the meantime Jupiter, the god of the sky, of the upper regions and of thunder, usurped the foremost place primitively held by Diana, the moon mother, becoming the titular deity of the Romans and the supreme god of the Latin races united under the imperial sway of Rome. Originally, as his powers, functions, titles and attributes indicate, he was the chief active, divine spirit of the heavens, a being to be feared and propitiated by a nomadic people, but one of no other very great interest to them. But though Jupiter grew to be the greatest of the Roman gods and was affectionately designated the All-father, yet he preserved to the last all the primitive earmarks of his nature origin. He was generally represented with the thunderbolts in his hand (the sign of his dominion over the elements), and the eagle (the thunder bird) by his throne. As the god of the dawn he was "the white one"; and in general everything connected with his worship was white. Even the consuls dressed in white when they sacrificed to him in their official capacity, and his priests wore white caps symbolical of the color sacred to him as representing the light of day, or more properly of the dawn or coming day. For the same reason white animals were offered to him in sacrifice.

Jupiter not only attracted to himself the attributes and qualities of other deities with many of their functions, but he also showed a signal power of extending all these acquired functions and, in a sense, organizing them into a component part of the system of state religion. One of the strangest of these developments is that of Juno, the female counterpart of the supreme deity himself, and the definition of the supposed female qualities of the sky. In other words she is but a subdivision of

Jupiter himself, whose sister and wife she is represented, in Roman mythology, to be. She bore the same relation to women that Jupiter did to men. She was the special protectress of women throughout life and she presided at birth, marriage and death, being ever the tutelary female genius, and by extension the guardian of national finances, as the Roman wife was of the household finances.

Next to Jupiter and Juno, his regal consort, the greatest of the Roman state gods was Mars, who, beginning as a deity of agriculture, as the Romans emerged from barbarism grew more and more the patron of war, as Jupiter's warlike functions and attributes became obscured in his assumption of the throne of the Roman pantheon. Yet as Jupiter never altogether outgrew his warlike associations so Mars never got completely away from his earlier agricultural connection. Jupiter, with Mars and Quirinus, formed the great triad of gods of the earlier state religion of Rome. The latter, who was the Colline deity of war, became the patron of soldiers and other armed people in times of peace; while Mars, who was especially honored in March and October, was the patron of the opening and closing of the war campaigns and of the sports connected therewith. Thus, in the readjustment of religious ideas, customs and practices, after Rome had extended her sway over all of Italy, the functions and attributes of the tribal deities became more and more specialized, each god, however, in the shifting of the scenes, retaining his most characteristic part and attributes. Thus Janus, the door-keeper, who is usually associated with Vesta, the keeper of the hearth, came, through a natural process of evolution, to preside over the beginnings of all undertakings. He was represented as having two faces, that he might see the more readily the beginning and the end of all things. He carried a staff (symbolical of traveling) and a key (the sign of his functions as doorkeeper).

Probably none of the greater of the Roman gods exemplifies better than Vesta the ever-changing character of the Roman deities. Originally the Roman virgin goddess of the blazing hearth, she was worshipped along with the Penates, at every meal when the family assembled round the hearth, which was situated in the centre of the room. Under the organized Roman state religion Vesta became symbolically the king's hearth, that is, the hearth of the nation, and as such she had a sumptuous temple near the king's palace. The vestal maidens belonging to this temple were known as the king's daughters, a title that was later on extended to the vestal maidens of all of Vesta's temples. According to the religious legend, Æneas was credited with having brought with him from Troy to Rome the sacred fire of the vestal temple on the Forum, where it was guarded with the most solicitous religious care by four (later six) virgins of the purest character, called vestals, who were dedicated to the service of Vesta from an early age (6 to 10 years) for 30 years, after which they were, by law, permitted to marry. Few, however, took advantage of this permission, even though it was considered a great honor to marry a vestal, upon whom rested the special favor of the goddess of the hearth. This was because

the office of vestal was considered one of special ecclesiastical dignity and honor and carried with it a certain influence.

Naming the Deities.—In general the Roman gods were named from their qualities, functions or actions. Often the primitive sense of the name is exemplified in the future actions of the deity. One of the best examples of this is Ceres (Greek *Demeter* from *Gemeter*, *ge*, the earth, and *meter*, mother), the goddess of the earth, the bringer forth of fruit and the special patroness of growing grain and other plants. Though a Roman deity, she was said to have been the daughter of the Greek deity Kronos and his sister-wife, Rhea. The Romans early identified Kronos with their own agricultural deity Saturn, an ancient Italian god of the culture hero type whom tradition represents as having made his appearance in the reign of Janus and to have taught the Roman people the arts of civilization and especially agriculture and gardening. He is said to have become coruler with Janus, and later poets sang of their rule as the "golden age." His temple was in the state treasury, because he was represented to be the special patron of wealth. A female derivative of himself and his functions and attributes was his wife, Ops, the female divinity of fertility and plenty and the protectress of agriculture. Thus it will be seen that her functions largely overlapped those of Ceres. The latter, whose distinguishing symbols were full and flowing robes, poppies and ears of corn and who wore a corn measure for a headdress, was the mother of Proserpine, the queen of the under-earth regions, and of Bacchus, the god of the vine and of wine, its characteristic product. The origin of most of the other gods is as distinctly pictured in their names. The Lares, the spirits of deceased ancestors, were literally "the shining ones"; Ops denoted the plentiful harvest; Pomona fruit; Saturn the sowing of the seed; Vesta the glowing hearth; Ge the earth. Kronos, the oldest of the great gods, has come to signify time, if he did not originally do so; while the Penates, the gods of the interior of the houses, mean literally those within (*pemius*, within).

Ceremonies.—The Roman religion was distinctly ceremonial, and in this it betrays its nature worship origin. It possessed ceremonies for every event in life, and for almost every conscious movement of existence. Birth, infancy, puberty, marriage and death were all celebrated with elaborate and significant ceremonies. Each stage of the year, the days of the week, the progress of agricultural development, the special occupations of the individual, the successive seasons of the year, the family meal, all had their individual and appropriate ceremonies at certain fixed times. These ceremonies, taken as a whole, represent the sum total of man's interests, faculties and powers, the whole inventory of which they covered, by anticipation, in the act of accomplishment or in fulfilment. The calendar year which began in March, for instance, was divided religiously into three seasons, spring, harvest and winter, to each of which was apportioned its appropriate and individual ceremonies. In spring anticipatory prayers were offered for the successful growth of the seed already planted; in the harvest season ceremonies were held in

connection with the gathering and storing of the harvest; while the winter ceremonies were directly related to the preparation of the ground for planting and the sowing of the seed. The elaborate ceremonies connected with these three seasons of the year grew into great national religious events famous in the life of the Roman people, both in the Imperial City and throughout the towns of the empire. So strongly had they become a part of the lives of the people after the débâcle of time had swept away the Roman faith, and after it the Roman Empire, that they remained standing forth from amidst the ruins, to influence largely the Christian festivals and calendar. There were scores of other characteristic Roman religious ceremonies covering the deference, devotion and offerings made to the great deities of the state religion and also those presented to the minor deities and personal and household guardian spirits. Most of these may be found described in any work on the subject under the name of each of the deities and spirits.

The medicine-man, conjurer, enchanter and worker of great magic inseparable from the religious ceremonies of primitive races had already developed into the formal priest when the Romans first appeared upon the stage of history in Italy. At this early period Rome seems to have also possessed her own religious rituals and sacred priestly knowledge. The priests soon became the first depositaries of writing and the organizers of the calendar and the religious tribal and state religious ceremonies in general. At this early period in the life of the Roman people, the superior priesthood seem to have been almost inseparably connected with the nobility and the kingly rulers, the latter of whom had already begun to lay claim to descent from the gods. The seeds of ancestor worship had also already been planted, a custom which was later on to deify kings and emperors, as the legal and de facto representatives of the gods upon earth. As early as 304 B.C. the first known religious ceremonial Roman calendar presents a list of 45 days in the year sacred to the gods and subject to prescribed ceremonial. No work was permitted on these days. Following this first ceremonial regulation and the Julian calendars, (46 B.C.) there were some 30 other calendars, all issued with the same end in view, the recording and regulating of religious practices and ceremonies long in vogue. For this reason, though most of these calendars are fragmentary, they are of very great interest and value in the study of the religious and social life of the Roman people. They show plainly the organizing hand of a priesthood growing steadily ever more and more powerful, better organized and more closely connected with the state. According to the calendars, 30 or more gods were signally honored in the provision of special festivals, ceremonies, shrines and priests; and of all these definite and well-defined deities and ceremonies statements are presented which are invaluable for the proper understanding of the religious references so profusely scattered throughout Latin literature.

Evolution of Religious Thought.—Rome had about all the various and varying religious experiences sustained by later nations and peoples. In the early stages of her career she

had a strong and abiding faith in her gods and in their efficacy. The establishment of the state control of religion was followed by a decrease of interest in religious matters by the more intelligent classes. From the end of the Regal Period to the Second Punic War Rome became gradually more cosmopolitan, assimilating the thought of the other parts of Italy in her almost continuously waged campaigns of war and commerce; and from the close of this latter period to the end of the republic, while working out her destiny as Imperial Rome, she came into contact with Greece and other highly-civilized nations; and her literature, thought and philosophy expanded and became truly national, assuming, at the same time, a world-wide outlook. This brought with it a radical revolution in religious thought leading directly to general scepticism. It looked very much as if the old religion were about to go by the board when the establishment of the empire saved it for the time being. The emperors, claiming to rule by divine right and direct descent from the gods, it was very much to their interest to uphold a state religion; which they did on a magnificent scale, bringing into the national church all the officers, employees and dependents of the government. The state church, at this latter stage, was an immense fraternity, all the members of which were bound, by virtue of their office, to support it. This revival of the ancient Roman religion was, therefore, less religious than political, though the royal family and especially the emperors took the matter serious enough, an attitude due to their careful education, which taught them to believe in their own divine birth and destiny. But on the whole this revival of the old faith was effected under conditions which could produce only a general scepticism; and this became the prevailing tone of the religious thought of the empire, which showed itself in the wide attention given to the most recondite philosophies, mysticisms and foreign cults of all kinds. Babylonian, Greek, Assyrian, Egyptian and Eastern religious ideas found welcome in Rome. The Great Earth Mother of Asia Minor and Isis, the mother goddess of Egypt, were not only introduced into Rome but their worship, which was accompanied with elaborate ritual and ceremonial, became almost universal throughout the Roman Empire; and such a firm root did it take among the masses of the Roman people and the Eastern nations under the domination of Rome that the early Christian missionaries found great difficulty in eradicating it.

One of the strongest of the Greek influences was exercised through the Sibylline Books, which introduced Greek gods, rituals, organizations, ceremonies and practices into Rome. Connected with these books was a very famous oracle who boldly recommended the introduction into Italy of foreign gods, especially those of Greek origin. As this cult became fashionable with the educated class, it spread rapidly throughout the cities of the Roman Empire. Greek gods were set up by the side of Roman, the new by the old; and the splendor and pomp of the ceremonies connected with the worship of both increased. Greek art and the wholesale manufacture of artistic statues of the deities followed. One of the recommendations of great moment of the Sibylline Books was that of the

introduction of the Magna Mater (the Great Mother), which helped to largely strengthen the worship of the Earth Mother, already mentioned. This was followed, on the same recommendation, by the introduction of the Earth Mother, Ma, of Phrygia. All these had very emotional rites and attractive ceremonies similar, in many respects, to those accorded Isis of Egypt. Hence they appealed strongly to a people already tired of the dead formality of the old state religion which had become so ritualized and fossilized that it had lost all its former vitality and attractiveness. This craze for foreign deities went to unheard-of extremes, going so far afield as Persia, from which was introduced the great sun god, Mithras, with his elaborate mystical worship, which became very popular in the Imperial City itself. From thence it spread over all the Roman Empire, where Mithras was worshipped as the source of all life and the redeemer of souls. His mystical rites, which were held in dark caves or gloomy buildings under ground, were attractive owing to their contrast to the gorgeous ceremonies of the state religion, in which it was said that no one still believed except the emperor and the poets; a hyperbole which conveyed the thought that it had become an integral part of the government machinery and of the imagery and machinery of Latin literature, which was overlarded with allusions to the state deities and given to fulsome praise of them, partly because this was pleasing to the state authorities. Thus Rome, bathed in philosophy, scepticism, mysticism, emotionalism and stoicism, with nothing solid to which to anchor, drifted upon the rocks of national religious shipwreck. In this condition she was found by the young and vigorous Christianity, which, throwing her weight strongly in the balance, won the day for the development of the Catholic faith.

ROMAN REPUBLIC. See **REPUBLICS**; **ROME**.

ROMAN DE LA ROSE, Le ('The Romance of the Rose'), a poem of nearly 23,000 verses, is the most notable and was for 300 years the most quoted and discussed French writing of the 13th century. More than 200 manuscripts of it have been classified; 18 edi-

tions were printed between 1481 and 1538; large parts were translated into English and Dutch in the 14th century; Chaucer used it freely in 'The Canterbury Tales.' The 'Roman' was begun by Guillaume de Lorris, in the style then fashionable of courtly, scholastic allegory, as an Art of Love and, incidentally, of polite behavior, for the use and pleasure of courtiers and their ladies. Under the form of a dream the Lover, aided by Courtesy, Sweet-Looks, Riches, Fair-Welcome and others, seeks possession of a Rose-bud, guarded by Danger, Shame, Evil-Tongue, Jealousy and so on. Guillaume drew the spirit and substance of his allegory largely from Ovid's 'Ars amatoria,' Chapelein's 'De arte honeste amandi' and the writings of Chrétien de Troyes. His work was apparently almost ended at his death, sometime between 1225 and 1240. With a brief conclusion by an unknown hand it counted 4,669 verses. Some 40 years later Jean de Meun took up the narrative in quite different spirit and in 18,000 verses, introducing many new characters, chief among them Reason and Nature, embodied the results of very wide if superficial reading and of daring speculations, political, economic, social and moral, anticipating much in Rabelais, Montaigne and Voltaire. Guillaume was no mean scholar or poet. His allegorical characters show keen analysis. He has faint premonitions of the Renaissance. But Jean's work gave the 'Roman' its abiding interest for it pressed social questions even yet not fully answered. He was a Parisian bourgeois. The site of his house has been identified at 218 Faubourg Saint Jacques. Many other writings, didactic and philosophic, are attributed to him. His purpose in the 'Roman' was, he says, "wholly for instruction." In digressions of 1,000 verses and more he seeks to apply Nature and Reason, that is, normal instinct and common-sense, in a thoroughly rationalistic spirit to the claims of royalty and nobility, to the origin of society and the ideas of the state, of justice, taxation and property, to the inequalities in the distribution of wealth and, with special and often quite misunderstood insistence, to the social position of women, their claim to equality as "free-born," and the evil effect on their characters of marriage as it had been developed under mediæval institutions. This gives occasion for much dramatically lively and often bitter satire. He condemns celibacy. The mendicant orders, typified in False-Semblance, embodiment of slothful hypocrisy, are his peculiar abomination. Speeches put in the mouths of the Duenna, prototype of Chaucer's Wife of Bath, of False-Semblance, the Friend, Reason and Nature, principally in the later half of the 'Roman,' best reveal Jean's radicalism. He finds place, too, for scientific speculations on the illusions of the senses and even on dissociations of personality. Through all this the allegory winds a slender thread leading to a philosophy of living more emancipated from theology than possibly the author realized. A symbolic celebration of Love as the self-perpetuating force of Nature ends with the Rose-bud in full bloom. Some two-thirds of Jean's verses hark back to older writers, chiefly Boethius, Alain de Lille and Ovid. He uses also Abelard and Roger Bacon and cites with complacent pedantry a host of others. He thought himself loyal to the Church, but his

temperament was practical, positive. Nature and her priest Genius, to whom more than a fifth of the whole poem falls, are the touchstones of his ethics and social philosophy, the real objects of his devotion.

The first scholarly edition of the 'Roman,' by E. Langlois (Paris 1914-) is in course of publication. Méon's edition (4 vols., Paris 1814) was good for its time. Michel's (2 vols., Paris 1864) is convenient, Marteau's (5 vols., Orleans 1878-1900) better. Consult Langlois, E., 'Origines et sources du Roman de la Rose' (Paris 1891); id., 'Les Manuscrits du Roman de la Rose' (2 vols., Lille 1910), also Bourdillon, F. W., 'The Early Editions of the Roman de la Rose' (London 1906); Ward, C. W., 'The Epistles on the Roman de la Rose' (Chicago 1911); Guillon, F., 'Jean Clopinel' (Paris 1903); Besant, W., 'French Humorists' (London 1873). There is a good, not quite complete, translation by F. S. Ellis (3 vols., London 1900).

BENJAMIN W. WELLS.

ROMAN WALLS, four great walls built by the Romans in Great Britain. The first of these stretched from the Firth of Forth to the Firth of Clyde. It was built by Agricola in 80 A.D. In 83 he strengthened it by another wall, and in 139 Lollius Urbicus again built over the same ground, the wall being known as the wall of Antonius. These walls were built to keep back the northern barbarians, who in the form of Picts and Scots continuously menaced Roman rule in Britain. Hadrian, concluding that the walls of Agricola were insufficient for this purpose, built in the early part of the 2d century the famous wall that stretched between Newcastle on the Tyne and Solway. This wall, finished in 120 A.D., was 68 miles in length, and marked the northernmost limits of Roman territory in Britain after that date. It is known as the wall of Severus, since that ruler strengthened it in 209 by building a parallel wall a few yards above it. Few remains exist of any of these save the last which may still be easily traced. Consult Bruce, 'Roman Walls' (1855); 'An Account of the Roman Antiquities Preserved in the Museum at Chesters, Northumberland' (London 1903); Westcott, J. H., 'The Roman Wall in Britain' (in *The Classical Weekly*, Vols. XVIII-XX, New York 1911).

ROMANCE, a fictitious narrative in prose or verse, the interest of which turns upon incidents either marvelous or uncommon. The name is derived from the class of languages in which such narratives in modern times were first widely known and circulated: these were the French, Italian and Spanish, called the Romance Languages (q.v.). The treatment here given must omit any extended mention of certain isolated romances in the later Greek. A well-known example of such is 'Apollonius of Tyre,' at one time widely read in the west of Europe; transmitted to England, first probably in a Latin version, it was soon translated, and was employed by Shakespeare for the plot of 'Pericles, Prince of Tyre.' Nor can the limits of the subject admit of discussion of some few Latin works sometimes classed as romances, such as the 'Golden Ass' of Apuleius, of which use was made in 'Don Quixote' and 'Gil Blas.' For such, see articles on individual titles and authors, and the general articles on the Greek

and Latin literatures. For general consideration the subject may be restricted to the Middle Ages. The finest of these romances still extant are of the 12th and 13th centuries. They may be divided into two classes—the popular epics (*chansons de geste*) chanted by the jongleurs and other strolling minstrels; and the more elaborate and artificial poems composed by trouvères and recited before aristocratic audiences.

The materials of both classes were more ancient lays of celebrated heroes, mingled frequently, especially in the German romances, with pagan myths, together with long connecting passages composed by the minstrels themselves. Hence originated a series of epics grouped around some renowned hero, and forming a cycle of romance. To the first class belong the German heroic poems and the Carolingian chansons; to the second the Arthurian legends.

Of the collection of the ancient German lays made by Charlemagne, nothing remains except perhaps the fragment of the alliterative Lay of Hildebrand, now in the Cassel Library. It is supposed to have been written in the 9th century or even earlier. All the other manuscripts of German heroic poems are of much later date; none of them are earlier than the 13th and most of them belong to the 14th or 15th centuries. Of the 'Nibelungenlied' (q.v.) there are three copies belonging to the 13th century. In this epic Dietrich plays an important part; but the poems devoted to the simple Dietrich legend are only found in late transcripts or early printed editions, probably little later than the date of their actual composition. They represent, however, older lays, and these again still older, of equal or even greater antiquity by two centuries or more than the Cassel fragment. The language changed considerably in the course of these centuries, and the poems must have been entirely recast, rhyme being substituted for alliteration; but the change in the legend itself is immaterial. It can be traced in the Latin chronicles of the 10th and 11th centuries, and also by means of the 'Vilkina Saga,' an Icelandic prose work of the 13th century. These poems, as well as others on similar subjects, range from a few hundred to several thousand lines in length. Some of them were modernized by Caspar von der Röhn, and inserted in his 'Heldenbuch.' The completest collection is that in Heinrich von der Hagen's 'Altdeutsche Heldenlieder' (1855). Another poem closely connected with the Nibelungenlied is the Latin epic of Walter of Aquitaine, attributed to Ekkehard I, abbot of Saint Gall, who died in 973, and is said to have written it as an exercise in his youth. It is obviously a translation from a German poem, and is found in several manuscripts, none of them perhaps older than the 12th century. The 'Klage' ('Lament'), said by W. Grimm and others to be a poem of the 12th century, forms a sort of conclusion to the great German epic; and another poem, 'Biterolf,' is ascribed to the same unknown author. It extends to 13,000 lines, and contains a great number of daring adventures, in the course of which Dietrich encounters and vanquishes Siegfried. 'Gudrun' is a fine epic of nearly 7,000 lines, and is of not much later date than the 'Nibelungenlied.'

We can only mention the names of the poems which make up what has been called the Lombard sub-cycle, namely, 'König Ruther,' 'Wolf-

diétrich' (including 'Hugdiétrich'), and 'Otuit,' which latter furnishes the materials for the French poem 'Huon de Bordeaux.' Frederick Barbarossa was a great admirer of Charlemagne, and collected all the accredited records of that monarch. He patronized the minnesingers as the German representatives of the troubadours. At his great Mainz tournament were assembled not only the knights of Germany and France, but the poets also. Among those present was Heinrich von Veldeke, who imitated the 'Roman d'Eneas' in his 'Eneit,' an example quickly followed by the chief leading epic poets of Germany. Heinrich completed his poem at the Wartburg, the residence of Hermann, Landgrave of Thuringia; and many other translations, among others that of the 'Roman de Troie,' were executed there shortly afterward. Another guest of the landgrave's was Wolfram von Eschenbach, author of 'Parzival.'

The *chansons de geste* form an interesting body of literature. The oldest of them are of great length, consisting generally of 20,000, 30,000, or even as many as 56,000 lines, grouped in sets (*tirades*) of from 20 to 200 lines, all ending with the same assonantal rhyme. Up till the middle of the 12th century the lines were of 10 syllables, but lines of 12 syllables, ending in consonantal rhymes, were gradually substituted. The romances were sung to the sound of a kind of violin (*vielle*), played with a regular bow. Many of the minstrels (*jongleurs*) were poor, wandering on foot from village to village, singing in the alehouses, or at the public fairs and games; some were soldiers, such as Taillefer, who struck his first blow at Hastings. Later they became mere mountebanks. A number of them wrote their own chansons, while others bought them from their original authors, and adapted them to the taste of their audience. When a jongleur had thus procured a copy he took care to conceal it from his rivals. A few of such copies, little weather-beaten volumes, are still preserved, a noted example being the Oxford manuscript of the 'Chanson de Roland.' It was to the poets of northern and central France rather than to the troubadours of Provence that these poems were due. The *chansons de geste* are divided into three cycles — that relating to Charlemagne and his peers, the Arthurian and the classical. The more antique the Charlemagne romances are the more they are devoted to the emperor, who is represented more as a majestic king and valiant knight than as the statesman we recognize him in history to be; at times he is depicted as being easily duped, avaricious and capricious. Among such works are 'Girard de Viane'; 'Ferabras' or 'Fierabras'; and the 'Chanson de Roland.' The centre of the entire structure is the 'Arthurian Cycle.' In the lays of the Welsh bards, supposed to be as old as the 6th and 7th centuries, although no manuscript extant is of earlier date than the 12th century, Arthur and his companions are celebrated, but temperately, the element of the miraculous being absent. It is in the 'Historia Britonum' of Abbot Nennius (apparently written in Welsh in the 8th century, and translated into Latin afterward) that the legendary additions begin to develop. Of three or four centuries later date are the so-called 'Armoric Collections' of Walter, archdeacon of Oxford, from whom Geoffrey of Monmouth professes

to translate, and in which the supernatural and marvelous elements largely prevail. The 'History' of Geoffrey was versified in French (1155-58) by Wace, a son of one of the Conqueror's followers. The 'Brut,' as this metrical setting is called, contains about 15,300 eight-syllable lines, and adds a few details to the story of Arthur which do not seem, however, to have been Wace's own invention. The work was translated into English, and further amplified, by Layamon, about 1204. The 'Brut' of Layamon is composed of nearly 32,250 alliterative lines, or rather half lines. One of the most prolific of the Arthurian poets is Chrétien de Troyes (born about 1140).

One of the finest of the early French Arthurian romances, 'Tristan' or 'Tristram,' was adapted by Gottfried of Strassburg, who left his 'Tristan und Isolte' slightly incomplete, about 1210. Other poems belonging to the cycle are the 'Morte d'Arthur,' a fine alliterative work of the 14th century; a Latin 'Life' of Merlin, in 1,529 hexameters, written about 1217; 'Li Biaus Desconneus,' a narrative of the adventures of Giglain, son of Gawain, written by Renauld de Beaujeu about 1200, and imitated by Wirt von Gravenberg in his 'Wigolais' (about 1212). From France the Arthurian romance spread also into Provence, Spain, Italy and the Netherlands, and was again transplanted into England.

The last of the cycles are the *classical*, in which the subjects are Alexander the Great and the Trojan heroes. The materials for the Alexandrine poems were found in an old Greek romance, written in Alexandria between 100 and 300 A.D., and known as the 'Pseudo-Callisthenes,' which was long read as authentic history, and of which there is still extant two Latin abridgments belonging to the 9th and 10th centuries. The most important romance on this subject is 'Le Romans d'Alexandre,' written by Lambert li Tors and Alixandre de Bernay in the 12th century; it contains upward of 20,800 12-syllable lines. This was the chanson that established the whole sub-cycle, and first brought the Alexandrine line into vogue and gave it its name. It concludes with the testament of Alexander and the lamentations of his 12 peers. Many French poets continued the subject. (See separate articles on the personages and the works mentioned; also FICTION; and PROVENÇAL LITERATURE.) Consult Billings, A. H., 'Guide to the Middle English Metrical Romances' (New York 1901); Courthope, W. J., 'The Connexion between Ancient and Modern Romance' (Oxford 1911); Hurd, R., 'Lectures on Chivalry and Romance' (Oxford 1911); Ker, W. ROMANCE LANGUAGES, the languages derived from the Latin tongue. These languages are very largely Latin in vocabulary and grammatical structure. The Romance languages had their being in the territory included within the Roman Empire. But not all of this territory produced Latin tongues for the simple reason that not all of it had become so Latinized that the Roman language had become that of the masses of the people. Through the colonizing efforts of Spain, Portugal and France, the Romance languages have spread beyond their original habitat, especially to Central and South America, where they have become the official speech of over 80,000,000 people. Romance languages are also spoken in many of the West Indies and part of Canada.

Italy, in the days of the Roman Empire, was subject to strong dialect influences against which the literary tongue had constantly to struggle. Little by little these influences gained the upper hand and literary Latin began to lose its complex grammatical forms and to become more analytical in construction. The northern end of the Italian Peninsula was considerably influenced by the so-called barbarian invaders and the south was overrun by Greeks, Carthaginians, Phœnicians and other races. The downfall of Greece had brought to Rome thousands of Greek scholars and teachers, all of whom were forced to use the Latin tongue, in which many of them learned to write fluently. These Greek scholars had a very considerable influence upon the development of the Latin language. In the later days of the Roman Empire, German and other mercenaries were extensively employed in Italy and throughout the Latin domains and prominent and influential men from the provinces in France, Spain, Britain and other parts either paid long visits to Rome, or lived there with their families. The number of these foreigners resident in Rome alone was very great, so that the cosmopolitan centre, where three languages, Latin, Greek and Italian, seem to have been recognized by the authorities as early as the first half of the 1st century of the Christian era, for we are told that one of the Cæsars returning from a protracted and successful military campaign gave the customary popular festivities belonging to such an occasion, which, in this case, lasted a month. One part of these festivities consisted of dramatic entertainments open to the public and given in Latin, Italian and Greek. The suggestive part of this act is that the Greek colony in Rome, at this early date, was so strong and so influential as to demand official recognition at the hands of a returning conqueror seeking public favor. Quite as suggestive is the fact that the dialectic influence at work within the Imperial City had already become so strong as to demand recognition at the hands of the authorities. The popular speech must have already become very considerably differentiated from the literary tongue, since it was thought good politics to give public plays in the former. Out of the service of people from all over Italy, in the Roman army for many years, sprang a sort of common tongue that was very considerably different from Classical Latin. This bastard Latin was carried by the army to every country over which the arms of Rome triumphed. Thousands of Roman soldiers and other Italian colonists

settled in the provinces and many of them intermarried with the natives. As the way to preferment everywhere throughout the Roman Empire could only be found through the acquirement of the Latin tongue, the study of Latin seems to have soon become popular in the provinces, where the speech of the Roman soldier was naturally much more prevalent than the Classical Latin of the literary men and the higher government officials. In this way the so-called Low Latin became domesticated in the provinces, where it seems to have been accepted everywhere as the most convenient medium of business transactions not only with the natives but also with the Roman colonists from the interior and south of Italy. This curious *lingua franca*, if it may be so called, seems to have continued its disintegrating influence upon the Classical Latin tongue, which rapidly lost most of its grammatical inflections and became analytical in form. This change must undoubtedly have assumed definite shape in the tongue of the masses some considerable time before we have any existing record of it in the shape of surviving documents written in the popular speech. It began early to influence literary or written Latin, and its iconoclastic hand is seen strongly in the Vulgate which has made many concessions to the popular speech; and in other Latin writings of the same and somewhat earlier and later periods.

While the Classical Latin tongue continued to disintegrate and to reshape itself as an analytical language on the Italian Peninsula, it was subject to still greater disintegrating influences in the provinces, where each native race impressed its racial and linguistic characteristics upon it. In fact these racial characteristics are noticeable in a striking degree in Italy itself where the tongue of the north is different from that of Rome and the west generally and both are radically different from that of the south and southwest and the adjacent coastal islands. In the provinces the new Latin tongues that grew out of the decaying Latin shaped themselves in accordance with the tribal influences brought to bear upon them. Italian naturally keeps closer to the Classical Latin than most of the other Romance tongues. Yet the various dialects of southern Italy shows a wide divergency from the Classical tongue. In Spain and Portugal, where the Latin occupation had most influenced the native population, the Latin vocabulary suffers less contraction than in France. Yet in Catalonia and the east coast of Spain, and in the Provençal districts of France, the tendency toward the suppression of unaccented vowels and word terminations is very noticeable. All this indicates that strong tribal influences were at work shaping the Latin tongue in conformity with the local lingual tendencies. Out of these various native lingual influences grew the modern Romance languages, Italian, French, Spanish, Rumanian, Romanish, Portuguese, Sardinian, Dalmatian (now extinct), Provençal, Catalán and Franco-Provençal. The formation of these Romance tongues was possible only through the spread of Roman rule and the predominance of Latin over Etruscan, Umbrian and other Italian dialects, and also over Iberian and Gallic. The power of Rome in the provinces was shown in the imposition of the Latin tongue on the inhabitants of France and Spain.

throughout practically all of which territory and the rest of the vast Roman possessions it was, by the time of Augustus, spoken, with unimportant dialectic variations.

Notwithstanding the fact that the Romance languages are essentially Latin in vocabulary, yet many changes took place in the Roman tongue before it finally became one of the Romance languages; and these changes were not always the same. Even in France itself there were two distinct forms of the Romance tongue, and various dialects. In Spain the Castilian and the Catalán developed differently; and there also grew up different dialects which still mark off very distinctly different localities of the Iberian Peninsula. Similar conditions prevailed in Italy. The Italian spoken in the Po and Liguria districts very much resembles the northwest Romanic speech; but it has evidently been also influenced by the dialects of other parts of the country, which forced upon it the loss of the "s" so common in the Iberian tongues. In the centre of Italy the Italian dialect was considerably influenced by the northern speech; but in the south, a combination of native dialectic speech and Greek and other influences worked together to produce a very considerable variation from the speech of northern Italy in vocabulary, accent and idiomatic turns of expression. In Portugal, too, local conditions produced a Romance tongue considerably different from Spanish, French and Italian.

The breaking up of the Roman Empire, removed the one great tendency which held together the various different ethnic elements that composed the Roman domains. Political disintegration followed and brought with it the isolation of various districts. This isolation was helped by the invasion of the Latin country by various Germanic tribes. The Goths, Lombards and Franks have left their traces on Italy; in Gaul, the Franks took possession of the north, the Burgundians of the east and the Visigoths of the south, during the last half of the 5th century. The Visigoths also overran most of Spain. Under these new conditions new groupings of people succeeded, and out of them sprang new and vigorous nations each of which spoke the Latin tongue in its own way. Soon the people speaking the new tongues could not understand Latin, a proof that the conditions that produced them must have been working silently for a very considerable period of time. Rapid changes in the form of the vocabulary and grammar of these new tongues followed. The primitive peoples who had fallen heir to the Latin language found it too complicated for their simple uses. So they promptly discarded the future and the passive forms of the verb and, in most cases, made the plural form end in "s." Later on, when they found the need of the future and passive, they formed the former by means of an auxiliary verb and substituted for the latter a reflexive form. The Latin genitive, too, gradually disappeared, and the accusative became the common form of the substantive after prepositions, and finally the only form. The future had early been replaced by the present; and this old use of the present and also its employment to replace the perfect is still common in dialect speech and the language of the illiterate in the Romance tongues. The profuse use of diminutives in -ulus and -ellus, noticeable quite early in the Romance tongues, was carried to excess in Italian and Spanish; and the Latin Americans have so abused this effective feature of the Romance tongues as to injure the beauty of Spanish. Articles were also manufactured out of the pronouns *ille* and *ipse*, which assumed distinct forms in the different Romance languages. The genitive, when it went by the board, was replaced by *de* with the accusative. The frequent use of the accusative in this connection led to the suppression of the nominative and the employment of the accusative in its place, thus aiding that simplicity which always appeals to rude undeveloped intelligences.

The causes that led to the formation of the Romance tongues had their origin, for the most part, in phonetics. Since the vocabulary of these languages is still essentially Latin, Spanish has radically simplified and developed the full sound of the vowels at the expense of the consonants. The Latin accented *e* becomes, in Spanish, *æ*, and the *o* becomes *æ*, while there is a strong tendency to weaken the initial consonant. Thus the Latin *porta* becomes *puerta* in Spanish, *tempus* becomes *tiempo* and *bonus*, *bueno*. Portuguese, on the contrary, is very careless in the articulation of both vowels and consonants; it avoids the diphthongs that Spanish likes, and as if going to the opposite extreme, the initial sounds are strongly pronounced. Portuguese, like French, has a strong nasal tendency, which is entirely absent from Spanish and Italian. It has also, a strong tendency to contract unaccentuated vowels. The Latin *cælum*, for instance, which became *cielo* in Spanish, has become *ceo* in Portuguese.

French differs from Spanish in its suppression of the Latin final vowels, *a* excepted, or their transmission into *e*. This tendency is noticeable in Provençal and Catalán, but it is stronger in the north of France than anywhere else. This tendency to contraction has left the French tongue practically without accent, while the opposite tendency in Spanish has made the latter tongue one of the most, if not the most, sonorous of the Romanic group.

Germanic Influence.—The Germanic tribes probably helped toward the disintegration of the Latin tongue in Italy. But this disintegration was long protracted and slowly evolved as should be the natural growth of a language. This prevented the various foreign influences becoming great at any particular time. The German mercenaries, who were largely used in the Latin armies, naturally brought into the country numerous German words relating to their life and occupation, which belonged to the camp. The names of grains, animals and persons in use among the Germans, but unfamiliar to the Romans, bore their native designations on their introduction into Italy. These words naturally assumed Latin forms, and they so identified themselves with Latin speech that it is difficult, at times, to recognize their foreign origin. The Goths, Lombards and Franks influenced the northern and central parts of the Italian Peninsula much more than they did the south, where Greek and Carthaginian played a very considerable part in the local appearance assumed by southern Italian. This influence is still noticeable in the strong quantitative accent placed upon the

accented vowel throughout the south and south-west of Italy.

As the natives, after the Roman conquest of Gaul, continued to be the mechanics, artisans and laborers, they naturally contributed to the store of Latin words, designating such occupations by names given them in their own Gallic tongue. As Gaul remained largely agricultural, during the Roman occupation, and as, in the beginning, the Roman task masters and employers of labor found it easier to learn the native names for the implements of labor, grains and processes than to teach the natives the Latin designation therefor, many agricultural terms of Gallic origin became current in the Latin spoken in Gaul. The same thing happened to the native tongues in Spain and Portugal. In the south of Italy and the adjacent islands, for practically the same reason, agricultural terms and especially names of farm and garden products have generally quite different names from those they bear in other parts of the peninsula. Yet notwithstanding these natural differences and those occasioned by accent and intonation which distinguish the speech of one locality from another and the great language groups to-day throughout all the territory that once constituted the western empire of Rome, the Romance tongues are surprisingly Latin in the composition of their vocabularies, the changes that differentiate them from one another and that mark the dialects of each language group being very largely phonetical; for however great the changes may be that have taken place in the Latin vocabularies in their transmission into the Romance tongues, they have not materially interfered with the roots or the accents of the Latin words. This fact has rendered the task of the Latin philologists much easier than it could have been had the accented vowel not persisted, subject to certain regular known modifications.

Inter-influence.—Naturally, being so closely related and having a common origin within historical times, the Romance tongues have acted and reacted upon one another. Moreover they have been acted upon by the German language, since their rise to the dignity of national tongues. Of all the Latin tongues French has had the greatest, deepest and most far-reaching influence not only upon the Latin and German languages, but upon other languages of Europe; and the Norman French gave to English two-fifths of its vocabulary. This French influence, begun in the time of Charlemagne, has extended to our own day, and is still being unconsciously exercised, though now in a somewhat more restricted degree. As the diplomatic language of Europe, as the voice of the leaders of fashion, as the tongue of the profoundest and wittiest literary critics of Europe and the leaders of science and of Romance philology it has long continued to furnish thinking Europe with concise names and expressions as they have suddenly found the need of them. In the age of chivalry, in the Renaissance, and the centuries that witnessed the growth of diplomacy, the French tongue continued performing its good offices for the other languages of Europe. Even Germany and the other countries in which the Germanic languages were spoken felt this French influence strongly in the court, art, literary and military circles.

While the Spanish, Italian and Portuguese languages influenced one another and other European tongues, their influence was sporadic and very much less than that of French. Spanish and Portuguese were, to some considerable extent, influenced by the aboriginal American tongues; and many of the words from this source were passed on to the other languages of Europe. Many Spanish words came into English and some into French through the contact with Spain in the American colonies. Very many words derived from the indigenous American tongues are in use in the different Latin-American countries. The names of plants and animals, agricultural terms and the designations of places have contributed very largely to this Indian element in the Spanish tongue. However, the use of most of these foreign words is confined to localities in America and but a comparatively small number of these native designations have become domesticated in Spain. Yet, as they enter into the very lives of the Latin-American nations, they seem to have come to stay. They, therefore, help to make the Spanish tongue, as spoken in America, different from that of Spain. Thus the literatures of the different Latin-American republics have each its own peculiar individuality, marked by local vocabulary and terms of expression.

Spanish was also influenced by Arabic during the Moorish occupation of the country, and these Moorish words and idiomatic expressions have, many of them, been carried to America. In the same way, the Greek and Carthaginian words that found their way into Catalán, have found lodgment in the Spanish spoken in certain section of Latin America. See PHONETICS; LANGUAGE, SCIENCE OF, and each of the Romance languages.

ROMANCE OF THE ROSE. See ROMAN DE LA ROSE.

ROMANCERO DEL CID, a collection of romances or ballads which sing of the mighty deeds of Ruy Diaz de Bivar, the Cid Campeador, the national hero of Spain. Curiously enough there exists no single *romancero* in which are included all the Cid ballads. This is due to the fact that new ballads are being constantly found which had not been put into print. The first 'Romancero del Cid de Juan de Escobar' dated 1612 contains only 102 ballads, the most complete modern collection, that of Carolina Michaëlis de Vasconcellos of 1871, contains 205. It was during the 16th and 17th centuries that the ballads reached the height of their popularity and passed from the oral to the written stage. Most of the ballads we have preserved to-day are not ancient. The tales they tell are those of the old ballads but the language is that of the classic period, and some of them have unknown authors. The early ballads were the most oft-repeated and favorite parts of longer poems. They represent a more democratic form of literature than such long works as the 'Poema del Cid' and the 'Crónica Rimada,' poems of an aristocratic and chivalrous age. Often the ballad is the result of a popular embellishment of an event found in the longer songs. In the 18th century the Cid ballads decayed somewhat in popularity but during the Romantic period they flourished as never before. John G. Lockhart's 'Ancient Spanish Ballads' though containing only eight Cid ballads is important because it has been accepted as a classic by several generations of English-speaking peoples. A more scholarly but still poetic translation is James Y. Gibson's 'Eighty-three Cid Ballads.' The Cid ballads are dramatic, realistic and virile; they rarely lapse into the puerilities of some other types of folklore poetry. In them the Cid may be idealized from a historical point of view, but to the Spaniard he is the noblest type of warrior carried to the height of perfection. For a fuller account of the 'Romancero del Cid,' consult Fitz-Maurice-Kelly, James, 'Chapters on Spanish Literature' (I and IV); and Morley, 'Spanish Ballads' containing nine Cid ballads with vocabulary, notes, and excellent bibliography.

SAMUEL M. WAXMAN.

ROMANES, rō-mān'ēz, George John, English scientist: b. Kingston, Canada, 20 May 1848; d. Oxford, 23 May 1894. He was graduated in 1870 from Caius College, Cambridge, studied in France, Germany and Italy and in 1874-76 worked under Burdon Sanderson in

the laboratory of University College, London, and carried out important researches in nervous excitability. In 1879 he was elected Fellow of the Royal Society and in 1878 published, under the pseudonym 'Physicus,' a work entitled 'A Candid Examination of Theism,' in which he took up a somewhat defiant atheistic position. Subsequently his views underwent considerable change; he revised the 'Candid Examination,' and toward the close of his life was engaged on 'A Candid Examination of Religion,' in which he returned to theistic beliefs. His notes for this work were published after his death, under the title 'Thoughts on Religion,' edited by Canon Gore. Romanes was an ardent supporter of Darwin and the evolutionists and in various works sought to extend evolutionary principles to mind, both in the lower animals and in man. He wrote very extensively on modern biological theories. His chief remaining works are 'Animal Intelligence' (1881); 'Scientific Evidences of Organic Evolution' (Nature Series, 1882); 'Mental Evolution in Animals' (1883); 'Jelly-fish, Star-fish and Sea Urchins' (1885); 'Mental Evolution in Man' (1888); 'Darwin and after Darwin' (1892-95); 'Examination of Weismannism' (1893); 'Mind and Motion, an Essay of Monism' (1895). In 1896 appeared a volume of 'Essays,' a selection from his 'Poems,' and his 'Life and Letters,' edited by his wife. Consult Carus, P., 'Dawn of New Religious Era' (Chicago 1899).

ROMANESQUE ARCHITECTURE. The somewhat misleading name Romanesque is applied to the non-Byzantine architecture of Christian Europe generally, from the fall of Rome (476) to the rise of Gothic architecture in the 12th century. Its greatest development began with the 11th century and continued well into the 12th. While in certain regions the influence of Roman remains was considerable and while in Italy traditions of Roman design persisted long, the outstanding characteristic of the Romanesque architecture generally is its independent development along predominantly structural lines as the parent of the splendid Gothic styles of the 13th to 15th centuries. It has, indeed, been called by some writers the "round-arched Gothic" style. It was throughout an architecture of religion, because the Christian Church was the chief civilizing agency of the early Middle Ages. Outside of Italy, and to a great extent there also, it was an architecture of monasteries, especially of the great Benedictine order. It is, however, really not one style but several. In Italy it developed the Basilican or Latin style in and around Rome, the Lombardy style in Lombardy and the north, the Tuscan Romanesque in Florence, Pisa and their neighborhood. The Byzantine style was influential in eastern Italy and in Sicily the Arabic and Byzantine influence mingled with the basilican tradition. Another phase was later developed along the Rhine Valley. It was in France that it took on the greatest independence and vitality, though there, also, are many marked provincial variations; and from Normandy it spread to England, taking on a new character called the Norman, or more properly the Anglo-Norman.

General Character.—All the Romanesque styles show steady progress from the crude and simple efforts at architectural expression of

communities slowly emerging from the chaos of the centuries following the fall of Rome, toward a highly organized, structurally elaborate type of church edifice and of monastic buildings. The church *plan*, at first simply basilican (see *BASILICA*), became increasingly varied and complex to meet the growth and changes of liturgy and ritual. The transept and crossing became more important; a lantern, tower or dome was often erected over the crossing; the eastern arm of the church was lengthened and chapels for the worship of various saints opened out from the transepts and apse. Bell-towers were added, detached in Italy, attached in France, England and Germany. *Structurally* two great changes from the early basilican types were evolved; (a) masonry piers, square, round or clustered, took the place of columns between nave and aisles; and (b) vaulting gradually replaced the wooden ceilings, first in the side-aisles, later in the high central aisle or nave. In Italy the supply of antique marble columns led to a longer continuance of the use of columns, the tradition lasting even after Roman shafts were no longer to be had, and many Lombard, Tuscan and Sicilian churches have columnar interiors. Elsewhere piers of stone had to be used from the first. The use of vaulting was primarily the result of scarcity of timber and of the destruction by fire of many of the wooden-roofed churches. These two changes compelled a far more massive construction than that of the non-vaulted wooden-roofed, columnar basilicas. The masonry was at first crude and heavy, especially in France and England. Walls were thick; round arches were universally used and built of stepped section with splayed or stepped jambs and jamb-shafts, especially in the doorways. Carving was at first scanty and rude, but advanced steadily in richness and refinement and in the 12th century sculpture was rapidly developed, especially in France. Vaulting became more scientific; groined vaults everywhere displaced the heavy barrel-vault over the nave as well as the side-aisles and in the 12th century the use of vault-ribs became general in their construction. The problems of support and abutment created by these changes compelled new experiments in the construction of walls, piers and buttresses, in which the masonry was more and more concentrated at the points of chief strain. (See *BUTTRESS*; *VAULT*). In all this structural development wholly new forms of architecture were created, both in the masses and details. In addition the monasteries developed the cloister with its arcaded court and various types of chapels, refectories and other dependencies. In general the exteriors of buildings were severely plain, except the richly carved portals; the interiors of churches were increasingly spacious and lofty as the style developed. Domical baptisteries and round chapels were frequent in the earlier centuries, especially in Italy and the Rhine Valley.

The Subordinate Styles.—The *Lombard* churches adhered in many cases to the basilican plan with wooden roof-ceiling; but vaulting was also early used, as in San Ambrogio, Milan, and the vaulted churches varied greatly in plan. The round window, the splayed and shafted portal with a porch and the arcaded cornice are

characteristic. The *Tuscan* employed banding and paneling in white and black marble externally and in and around Pisa richly arcaded façades were common. The great domical baptisteries of Florence and Pisa also belong to this style. The *French Romanesque* churches were frequently vaulted, sometimes with barrel-vaults (Autun, Clermont-Ferrand, Issore); more often with groined vaults as at Caen. The exteriors became increasingly varied and structurally expressive, with twin towers at the west end and figure sculpture attained high merit (Saint Trophime and Saint Gilles at Arles; Chartres). In parts of central France (Périgueux, Angoulême) domical vaulting betrays Byzantine influence via Cyprus and Venice. The *Anglo-Norman* churches, often of vast size (e.g., Saint Alban's, over 500 feet long) were almost always roofed with wood over the high central nave, with vaulted side-aisles. Square central lantern-towers, round nave-piers and the carved zigzag are frequent. The *Rhenish* abbey churches are noted for their picturesque masses and many towers: they often have an apse at each end (Worms, Mayence, etc.). In the 12th century many wooden-roofed churches in France, England and Germany received vaulting.

ROMANINO, Girolamo, jě-rō-lā'mō rō-mā-ně-nō, Italian painter: b. Brescia, about 1485; d. there, 1565. He was a pupil of Ferramola in Brescia and between 1509 and 1513 lived at Padua and Venice, where he studied the rich golden coloring of Giorgione and learned the art of reproducing it in his own works. After completing (1519-20) four frescoes in the cathedral at Cremona, he returned to Brescia. All his pictures are remarkable for their skilful composition and splendid coloring, but in his later works his tones become silvery, clear and cold and lose the warm lustre of Giorgione's sunset tints. He painted many

altar-pieces, of which the most remarkable are 'Madonna and Child' and 'The Madonna with the Dead Christ' (in Berlin Museum); 'Adoration of the Infant Christ' (in the London National Gallery, a good example of this painter's manner); 'Nativity (in the Church of San Giuseppe at Brescia); and an 'Assumption' (in the Church of Sant' Alessandro, Bergamo). He also painted some frescoes in the castle of Malpaga near Brescia, the home of the famous Colleoni, the commander of the Venetian armies. There are some fine portraits by Romanino to be seen at Brescia.

ROMANOFF, rō-mā'nōf, the name of the late reigning family in Russia, founded by Michael Feodorovich Romanoff: b. 1598; d. 1645. He was descended through his grandmother from the family of Ruric, the founder of the Russian empire and came to the throne in 1613 by election of the boyars and the higher clergy. The early part of his reign was troubled by the Poles and by turbulent nobles. Western civilization gained an entrance into the country and many foreigners, particularly Scotchmen, became naturalized. France tried to disturb the commercial monopoly of England in Russia. Michael was succeeded by his son Alexis and the male succession of the Romanoff family continued until the death of Peter II in 1730, when the crown devolved upon Anne, Duchess of Courland and continued in the succession of the female Romanoffs until the death of Elizabeth in 1762. The latter was succeeded by her nephew, the son of the Duke of Holstein-Gottorp, who ascended the throne as Peter III and established the dynasty of Romanoff-Oldenburg, which ended with the deposition of Tsar Nicholas II (q.v.) in March 1917. Consult Bain, R. N., 'The First Romanovs' (New York 1905) and Edwards, H. S., 'The Romanoffs: Tsars of Moscow and Emperors of Russia' (London 1890).

ROMANS, Epistle to the. Authorship.—That the Apostle Paul wrote the Epistle to the Romans is practically undisputed, for the very few critics who have ever denied it (scarcely more than the little "Dutch School" of the latter part of the last century) have found no recognition for either their arguments or their conclusions. The claim of Pauline authorship in the opening address (i, 1) is confirmed not only by unanimous tradition but also by the whole tone and contents of the letter, so that sane historical criticism unanimously asserts it with the utmost positiveness.

Destination.—It is as little to be doubted that the letter was addressed to the Christians in the city of Rome. The name of the city stands both in the opening address and a little later in the same chapter (i, 7, 15), and this is confirmed alike by unanimous tradition and by many things in the letter itself, as, for example, that Paul writes in i, 10-13 and xv, 23, 24, 28, in a fashion which would fit with no other city we can name, especially as we know from Acts xix, 21, that he did have the fixed purpose of visiting that city. While the omission of the name Rome in a few authorities, none of which is of any special value, raises a somewhat perplexing problem for textual criticism, the result is such as in no way to shake the confidence of scholars in the Roman address of the Epistle.

The Roman Church.—The origin of the Christian Church at Rome cannot now be traced. It is probable that many influences and elements combined to make it. Some Jews from Rome were in Jerusalem on the Day of Pentecost (Acts ii, 10) and they may in some cases have returned to Rome, carrying their newfound faith; when persecution scattered the Jerusalem Christians (Acts viii, 1), some may have wandered as far as Rome; as the facilities for communication throughout the empire were better than they were again anywhere in the world till during the last century, and as the capital of the empire was a great magnet which drew from all over the world, men and women who had elsewhere been converted to Christianity may have drifted to Rome in considerable numbers during the quarter of a century which intervened between the resurrection of Jesus and the writings of Romans. Thus even though the traditions of an Apostolic origin for that Church cannot be credited, it is easy to see that from the very nature of the case there must have been many Christians in the city when Paul wrote. Many would naturally be of Jewish descent, so that there is nothing improbable in the interpretation which many give to the words of Suetonius narrating the expulsion of the Jews by Claudius, to the effect that the disturbances were not due to the general Messianic hope, but to conflicts based on a difference of opinion as to whether Jesus was the expected Messiah. It is also known that there were many proselytes and others, who were associated with the Jews, being attracted by the lofty spiritual worship of their monotheistic faith and the strict purity of its moral precepts. It has been held by some that the church at Rome was mainly made up of Jewish Christians at that time but the prevalent opinion seems to be fully justified, especially by what we find in the letter itself as well as by the probabilities of the case, that the dominant element in the church was Gentile, as was doubtless already true almost everywhere outside of Palestine.

Date and Place.—From the epistle itself (xv, 25) we learn that it was written just before Paul's visit to Jerusalem to carry up the great collection which he had gathered from all the churches which he had founded. From Acts xx, 3, we learn that Paul spent in Corinth the three months before setting out on this journey, and everything fits with the view that this Epistle was written during the period of comparative leisure and calm which this visit may well have afforded him. There are also greetings at the close of the letter (xvi, 23), which are best understood as from Corinthian Christians, and Cenchreae, from which place Phoebe, the bearer of the letter, was to set out, was close by Corinth. While most of Paul's letters can be dated with satisfactory certainty so far as the relations to other events in his life work are concerned, there still remains much uncertainty as to the calendar years to which these events should be assigned. The date usually given to the stay in Corinth and the writing of Romans is the winter of 57-58, but some chronologists date the events accompanying its composition several years earlier.

Integrity.—There has been much discussion as to whether we now have the Epistle to the Romans in the form in which it was sent

to them by the Apostle, or whether it now contains material which has been added to its original form. This question relates mainly to the last two chapters. It is known that Marcion in the 2d century rejected these chapters, and there seems to be some evidence that such a shorter edition was in circulation in other circles of Christians. The doxology which in the Greek Textus Receptus, the Vulgate and the English translations stands at the end of the present Epistle (xvi, 25-27), is found in a considerable number of manuscripts, some versions and the works of several Fathers at the end of chapter xiv, while in a very few authorities it stands in both places. Also a system of notation for reading in church seems to have ignored all which comes after the end of the fourteenth chapter except the doxology. These facts may, however, be explained on either of two hypotheses, either that the section from xv, 1, to xvi, 24, was passed over in selecting Scripture readings for public use, and that this influenced copyists to drop it out, or that a shortened form of the Epistle was circulated for a time, possibly with Paul's own authority, as a sort of treatise or circular letter. The latter hypothesis would also furnish an explanation of the omission in two manuscripts of the words "in Rome" (i, 7, 15). A strong argument in addition to the overwhelming external evidence in favor of the text as it stands is the unity of the section xv, 1-13 with chapter xiv, which seems to show decisively that this was part of the original letter, and consequently that it could not have ended with xiv, 23. It is also held by some critics that the many salutations of xvi, 1-16, could not have been intended for the Christians in a city which Paul had never visited, and, therefore, that a letter of recommendation for Phoebe addressed to some other church, most probably Ephesus, has in transmission become combined with the letter to the Romans. There is, however, no real impossibility in the view that those whom Paul saluted may have been residing in Rome at the time. Some are known to have had a connection with Rome, as Prisca and Aquila, who may well be presumed to have returned from Ephesus to their old home as soon as practicable; many of the names fit quite as well in Rome as in Ephesus, especially the mention of the households of Narcissus and Aristobulus; and it has also been noted that the salutations are always more numerous in letters to churches where Paul had not worked than where he had, and he might well have desired to strengthen his hold in Rome by every possible appeal. Finally, it has been doubted that the closing doxology (xvi, 25-27), could have been penned by the Apostle, but against its genuineness can be urged only subjective impressions, the weight of which is fully neutralized by the equally trustworthy feeling of a much greater number of critics who find the doxology to be alike in sentiment and in expression clearly Pauline. On the whole, the conservative position, that we have the letter in the form in which Paul wrote it, has been by no means overthrown and is held by the majority of scholars with as much confidence as ever.

Occasion and Purpose.—It has sometimes been said that this Epistle is really a treatise rather than a letter, that Paul deliberately set about giving a systematic exposition of his the-

ology. But it is to be noted that the exposition is far from being a complete statement of Paul's doctrinal views, while on the other hand there is much in the book which is truly epistolary in character, so that this view cannot satisfy. Others have held that it was purely a controversial and polemic document, an endeavor to counteract the work of Judaizers at Rome as he had met them elsewhere. But while the arguments used are doubtless those which Paul had often used in controversy with his antagonists, yet the controversial note is much subdued, as will be seen if Romans is compared with Galatians, and there are no tokens that the Judaizers had already begun work at Rome, at least so far as Paul knew, though it may be that the vigor and sternness of the warning in xvi, 17-20, is due to news that the danger was less remote than he had hoped. The real purpose of the letter is best seen in connection with its occasion. Paul, who since leaving Antioch had worked only among churches of his own founding and had made them in turn in some sense a basis for his further work, now hopes to go to Rome where there are already numerous Christians, and after working there for a time to go on to Spain in further missionary endeavor. It is important, in order that his work among them may be successful, that they should have a clear idea of the way in which he presented his 'Gospel.' Accordingly he makes a somewhat full and systematic statement of the truths which he chiefly presented in his preaching, man's sin and God's grace of salvation through Christ. Necessarily reviewing to a great extent the various arguments used in controversy with the Judaizers, he makes a clear and well-reasoned statement in a form as conciliatory as possible, in order that so far as it could be secured in this way he might find a welcome and help in his work when he reached Rome.

Contents.—The epistle naturally falls into four main divisions, the first two of which are doctrinal, the third relates to the problem of the unbelief of Paul's own nation, and the fourth is ethical. After an epistolary address, expanded beyond parallel (i, 1-7), and some pleasant words about his desire to visit the Roman Christians (i, 8-15), he states in i, 16, 17 the theme with which he is to deal, viz., that the Gospel is the divine power to save. The truths in regard to this salvation he develops first in relation to forgiveness of sin (i, 18-v, 21), and then in relation to the spiritual consequences of this salvation as shown in the life of faith and goodness (vi, 1-viii, 39). It may be remarked that the significance and importance of the truths brought out in this section have been too much ignored both by friends and opponents of Paul's doctrine, and that men have too much failed to see that to him salvation was not a mere matter of release from the penalties of sin, but was also an inward and spiritual fact, that the right character and life by the power of the indwelling Holy Spirit is an essential part of the salvation which he preached. In chapters ix-xi the author deals with the problem how it was that the Jews as a nation did not accept Christianity. The concluding section (xii, 1-xvi, 27) is devoted to injunctions to live rightly in all the relations in which the

Christian finds himself. The whole book is dominated by an unparalleled note of catholicity and universality. All men are sinners and need a Saviour: salvation through Christ is for all men: even the unbelief of the Jews was in order that God might have mercy on all.

Value.—The epistle to the Romans has proved itself one of the greatest "books of power" which the world has ever seen. It is a masterful, though of course unconscious, revelation of what the great Apostle himself was. As Jülicher says: "In chaps. i-iv we have the Rabbinical schoolman, in viii and xi the inspired poet, in xiii and xiv the sober, careful director of conduct and in ix the bold thinker who follows out to its logical conclusion the argument which makes all things begin and end in God. The Romans would not be able to disregard such a man or to lock their hearts against him, unless they had previously determined to make no terms with him whatever." The influence of the thought it contains has been immeasurably vast and far-reaching. While it was somewhat overlooked for centuries, its influence on the spiritual life of Protestantism due to its rediscovery by Luther has been incalculable and this influence in varying measure continues to this day among the most profound Christian thinkers. Luther styled it "the chief book of the New Testament and the purest Gospel." Godet said: "M. de Presensé has called the great dogmatic works of the Middle Ages 'the cathedrals of thought.' The Epistle to the Romans is the cathedral of the Christian faith," and the philosopher Coleridge called it "the profoundest book in existence."

ROMANTICISM. The word "Romantic" is derived from the old Romanic or Romance languages, which were formed by a fusion of Latin as spoken by the common people of Italy with the native tongue of the northern barbarians who invaded that country. This Romance speech naturally assumed a variety of forms, but it reached its highest development in Provence, in southern France, where it became an important instrument of popular literary expression, especially during the 11th and 12th centuries. The compositions which appeared in this vernacular tongue were generally tales and ballads in which the adventures of knights in pursuit of honor, or in devotion to the Christian religion, or the enthusiastic deeds of chivalry, and the spirit of loyalty and reverence for women were portrayed. Another mark of this literature is its evident fondness for events that are strange, mysterious and supernatural. The name "romance" then, first applied to the language in which those compositions were written, came afterward to refer

to the prevailing characteristics which they displayed, as contrasted with the works written in Latin, which were termed "classical." During the 18th century, which delighted to term itself the "Augustan Age," and prided itself upon its purity and refinement of taste, the classical models and modes of expression were regarded as furnishing the only correct standards, while the literature and art of the Mediæval Period was regarded as barbarous, and its whole mode of thought and life to be characteristic of Dark Ages that were unworthy of the attention of a cultivated man. At the close of this century, however, and during the early decades of the 19th, a marked change manifested itself in the whole tone and tendency of the intellectual life of the time. This mental revolution, which is known as the Romantic Movement, affected all departments of thought, and all artistic and literary standards and modes of expression. From the first this movement showed a consciousness of its opposition to the generally received intellectual conceptions and prevailing artistic and literary standards of the time, though this contrast was less violently emphasized in England than in Germany and France. Goethe noted and commented upon the difference between the old tendency and the new, describing it as equivalent to that between the "diseased" and the "healthy"; while Schiller contrasted them as the "naïve" and the "sentimental." It was Friedrich Schlegel who first employed the terms "classic" and "romantic" to characterize this opposition. Since that time many writers have undertaken to define and explain the fundamental distinctions between these tendencies, especially as they express themselves in art and literature. The following points appear to be most significant: (1) The main marks of classicism are simplicity, directness and nobility, and perfection in achievement. In a classic work of art there are no evidences of a lack of harmony between the ideas and the medium, no suggestion of something remaining that cannot be expressed. As a consequence, the personality of the artist is not expressed, the artist is lost in his work, which stands impersonal and objective. He does not show us his own attitude toward the subject matter, his emotional struggles and the play of his life. The Romanticist, on the other hand, puts himself into his work; it is no disembodied idea of beauty that he seeks to express, but his own personality, the longings, hopes and ideals of a spirit that has a tendency toward the infinite, and which, therefore, can never express itself in any finite and objective medium. Classicism is thus always definite, objective and complete, while Romanticism is always touched with subjectivity, and thus with a suggestion of incompleteness, which is due to the fact that it seeks to convey the mystery of spirit for which no objective mode of expression is adequate, and which, therefore, can only be symbolized and vaguely suggested. (2) As Romanticism endeavors to express what is strange and mysterious in the life of spirit, it naturally seeks its material in the past and feels itself especially in sympathy with the Middle Ages, when the aspirations of the spirit, its love of adventure and sense of the mysterious expressed themselves in quests for the Holy Grail, in crusades and gallant deeds of chivalry and knight-errantry.

Thus a sympathy with the past, a new interest in humanity as such, marks Romanticism. (3) Just because classicism sought to express the idea of beauty in definite and objective form, it was possible to lay down fixed canons of procedure and so to render the result formal, precise and almost mechanical. Romanticism, however, aims to represent what is inner and subjective, and, therefore, necessarily protests against making art stilted and formal by the application of external rules and mechanical standards. Art, the Romantics declare, must spring from the untrammelled expression of the free spirit of the man of genius. "The will or caprice of the poet," as Schlegel says, "admits no law above itself."

The Romantic Movement.—The romantic movement may best be understood if we regard it as a part of the general intellectual revolution of the 19th century, and as one in spirit with the historical and scientific spirit of modern times. The entire spiritual attitude of modern life, as contrasted with that of the 18th century, may be characterized as a new consciousness of infinite possibilities and boundless aspirations. The spirit knows itself as infinite and is also conscious of the infinite task set for the individual through its own demand for expression and realization. The new tendency turns away in disdain from the mechanical conceptions and formal syllogisms in which the 18th century had self-complacently summed up the universe, it laughs to scorn the unintelligent and formal imitation of classical models that bases itself on ancient canons; it denounces the ethical principle of prudence; it declares that the infinitely mysterious law of life cannot be comprehended by the principle of self-love; it refuses to believe in a transcendent God. The new movement is thus romantic through and through, filled with a sense of mystery and wonder, with the love of adventure and discovery, and with the buoyant spirit of aspiration. As Wordsworth says: "In that dawning age 'twas bliss to be alive, but to be young was very heaven." This tendency to advance to new achievements manifested itself in many and various directions. In philosophy it led to a new and fruitful attempt to comprehend in more adequate terms God, nature and the place and significance of man's life in the universe. The result of this is seen in the systems of Kant and the German idealists. On another side the new interest in man and the affairs of man's life has given rise to the modern historical movement which has made its influence felt in every department of thought and culture. It is this historical interest, united with the Romantic spirit of adventure and discovery, which is just the assertion of the confidence of Reason in itself, that has called into being the evolutionary sciences of nature. The concept of evolution has transformed the older view of nature, just as it did our view of man when it was earlier applied to illumine his social, ethical and religious life. For evolution is just an attempt to explain the world by showing the relations between things as parts of a single living process. It, therefore, always emphasizes organic relationships and views things as parts or stages in a dynamic process, instead of taking each thing as something static, an element existing in isolation as something in itself

independent and having only external relations to other things. The Romantic movement in art and literature must also be regarded as an expression in different fields of essentially the same attitude of self-assertion and consciousness of the creative movement of life that is manifested in philosophy and the new sciences of history and biology.

Romanticism in England.—In England a new spirit was perceptible in literature soon after the middle of the 18th century. This new movement, however, was not so intense or so fundamental in scope as its counterpart in Germany, which began a little later. For the introduction of a natural literature into England, expressing a sympathy with nature and an interest in the past, while disregarding the rigid canons of the Augustan Age, was in a way but the restoration of the healthy natural traditions that had expressed themselves in Chaucer and Spenser, in Shakespeare and Milton, and in the folk-songs and ballads, which were collected and edited by Thomas Percy in his 'Reliques of Ancient English Poetry,' in 1765. It was thus not marked by the keen sense of opposition to the prevailing system that characterized the tendency in Germany, and at a later time, also in France. Moreover, perhaps for this very reason, it did not penetrate so deeply into the spiritual life of the people, or show its effects markedly in all departments of intellectual life, as in Germany. It appears mainly as a literary movement, with which is connected some new tendencies in painting, and also as a revival of interest in Gothic architecture, which Horace Walpole did much to promote. But the movement did not involve a fundamental transformation of philosophical and scientific conceptions. This transformation came about at a later period during the 19th century, and was largely the result of the influence of German thought as represented by Coleridge and Carlyle, aided by Darwin's discovery and applications of the doctrine of evolution. The names of Gray, Cowper, Scott and Burns are usually placed among the English Romantics, as well as those of Wordsworth, Coleridge, Southey, Byron, Shelley and Keats. A little later we have the revival of interest in Dante, which culminates in the pre-Raphaelite movement.

The Romantic School in Germany.—Lessing stands as the first to challenge the canons of the classic art and literature. Herder is at once the pioneer of the modern historical method and one of the first to appreciate the value of what is natural and spontaneous in literature. Influenced no doubt by the publication of Percy's 'Reliques,' he made a collection of the folk-songs of Germany. In Goethe's 'Werther' and Rousseau's 'Confessions' we have two books of nearly the same date that show many of the marks of extreme Romanticism. The name "Romantic school," however, is usually applied to a group of men whose main centre of activity was first at Weimar and Jena and afterward to some extent at Berlin, and whose work extends from about 1775 or '80 to 1806. The main names of this school are the brothers Friedrich and A. W. Schlegel, the philosopher Schelling, Novalis (whose real name was Friedrich von Hardenberg), Ludwig Tieck and the theologian Schleiermacher. The

main result of this movement was philosophical and æsthetic, though it led to some important results in the way of historical investigations. Heine, Immermann, Freytag and von Scheffel all exhibit the characteristic Romanticist fondness for the picturesque and the mediæval. Another group of men—Uhland, the brothers Grimm, von Arnim, J. Görres and Brentano, who represent a more distinctly literary movement with strong national characteristics—are often called the younger Romanticists, whose centre of activity was at Heidelberg, where their organ, the *Zeitung für Einsiedler*, was published.

Romanticism in France.—We have seen that Rousseau may in a sense be called one of the earliest Romanticists. As a result of the Revolution and the prolonged Napoleonic wars, literature received little attention in France during the years that were most fruitful in Germany and England. Chateaubriand and Mme. de Staël are sometimes said to be the fore-runners of Romanticism in France. But the tradition of classicism was strongly entrenched, and even Victor Hugo at first adhered to this standard. But in 1826 in the 'Odes and Ballads,' and in the following year in the preface to the play entitled 'Cromwell,' he declared his allegiance to Romanticism, and at once became the leader in a new cause into which he threw himself with all the fervor of his enthusiastic nature. Besides Hugo, the principal French Romanticists are Alf. de Musset, Ch. Nodier, George Sand, Th. Gautier and Balzac.

JAMES E. CREIGHTON,
Professor of Logic and Metaphysics, Cornell University.

ROMANUS I, rō-mā'nūs, **Lecapenus**, Byzantine emperor: d. Island of Protea, 948. He served in the imperial navy, and was in command of the Byzantine fleet on the Danube in 917, when hearing of the defeat of the army at Achelous, he at once set sail for Constantinople. His designs on the throne were furthered by his popularity with his sailors and the people, and after the marriage of his daughter, Helena, to Constantine VII he rose steadily in power, and in 919 was crowned colleague with his son-in-law. He exercised so much influence over the latter as to make him the real ruler until 944, when Constantine, aided by the sons of Romanus, caused him to be carried off to the island of Protea, where he was forced to become a monk, while Constantine was proclaimed sole emperor.

ROMBERG, Moritz Heinrich, German pathologist and neurologist: b. Meiningen, 11 Nov. 1795; d. Berlin, 17 Jan. 1873. He was educated at Berlin and at Bonn. He became *privat docent* at Berlin in 1828, lecturer there in 1830, and from 1840 until his death he was professor of pathology and therapy. He made important contributions to knowledge of the nervous system, several of his discoveries being named for him. In methods of diagnosis of nervous diseases he made notable progress, which is detailed in his 'Lehrbuch der Nervenkrankheiten' (1840-46; Eng. trans., Sievekind, E. H., 'A Manual of the Nervous Diseases of Man,' 1853).

ROMBLON, rōm-blōn', Philippines. (1)

A province consisting of a group of islands in the Visayan Sea, lying east of Mindoro and south of Luzon; they are near the centre of the archipelago, and the most northern islands of the Visayan group; area, 515 square miles. The northern islands of the group form with the islands of Mindoro and Marindique clear, deep channels, much frequented by Philippine boats; the islands are also indented with well-sheltered inlets and bays. The majority of the inhabitants of the province are Visayans; some Negritos are found on the island of Tablas, and Manguianes in Tablas and Romblón. Civil government was established in 1901. Pop. 55,339. The islands constituting the province are as follows: (a) Bantón, the most northerly island of the group; the surface is rugged except in the southeast; the soil is sterile and few crops are raised; the chief industry is the mining of gypsum, an excellent quality of which is found; area, 11 square miles; (b) Carabao, the most southern island of the province; its chief physical characteristic is a central cone-shaped summit, from which the land slopes regularly to the sea; it is heavily wooded, but not inhabited; area, 19 square miles; (c) Dos Hermanas, two islets of rock, separated by a channel two miles in width; area, one square mile; (d) Maestre de Campo, the most western island of the province; it is circular in shape and mountainous with steep shores; it contains one small village on the east shore; area, three square miles; (e) Romblón, the third island in size, giving its name to the group on account of central location and mineral wealth; (f) Sibuyán, the second largest and most eastern island of the group (see SIBUYÁN), and (g) Tablas, the largest island (see TABLAS).

(2) An island of the province of Romblón, lying midway between Sibuyán and Tablas, on the route of steamers passing through San Bernardino Strait and Verde Passage; area, 50 square miles. A central mountain range traverses the island from north to south, with spurs extending toward east and west. The chief occupation of the people is cattle raising; valuable deposits of quartz, marble and slate are found and quarried; the marble is exported in large quantities. This island is the seat of government for the province.

(3) Pueblo, capital of the province of Romblón, situated on the northwestern coast of the island of Romblón, the largest town of the province; it has an excellent harbor, one of the best of the Visayan group, and is the commercial center of the island. It has some old

fortifications originally built to defend it from pirates. Pop. 6,764.

ROME, Ga., city and county-seat of Floyd County, picturesquely situated at the junction of the Oostanaula and Etowah rivers, which at this point form the Coosa River. It is situated 72 miles northwest of Atlanta, 195 miles northeast of Selma, Ala., and 73 miles southwest of Chattanooga. Rome is on the Central Railroad of Georgia, the Southern Railway, the Western and Atlantic, and the Rome and Northern, the Nashville, Chattanooga and Saint Louis railroads. Both the Coosa and Oostanaula rivers are navigable. Rome has many modern business blocks, handsome churches and public buildings. Shorter University for Women is here located. It also has a United States post office and courthouse, opera-house, fine school buildings, municipal and library buildings, and national and State banks. There is a large and increasing trade here in cotton manufacturing and general merchandise. In the city and contiguous thereto are numerous cotton mills, planing mills, furniture factories, iron foundries, plow and scale works, ice mill, cottonseed oil mill, sash and door factories, tanneries, twine works, brickyards, sewer pipe works, tents, awnings, boxes and crates, mattresses and other smaller industries. The assessed property valuation of Rome is over \$6,000,000. Rome was incorporated as a city in 1847 and is governed on the commission plan since 1915. It has an electric light plant and waterworks and a street railway system. Pop. 14,146.

ROME, the capital of the Roman republic and empire, the Holy See, and of the kingdom of Italy since 1871, is in $41^{\circ} 53' 54''$ N. latitude (more than a degree further north than New York City) and $12^{\circ} 28' 50''$ E. longitude from Greenwich. Pop. about 539,000. Its nearness to the Mediterranean on the south and the Apennines on the east strongly influence its climate. The average temperature in winter is $49\frac{1}{2}^{\circ}$ F. and in summer $74\frac{1}{2}^{\circ}$ F. Snow, ice and frost are infrequent. Foreigners regard the summer as rather oppressive, but as there is both a mountain and a sea breeze the nights are reasonably comfortable except in July. The Tramontana wind from the Alps is bracing but menacing to those not warmly clad. The sirocco from the African desert is enervating and productive of nervous disorders—a fact recognized by the old law in Rome and held “an attending circumstance” in cases of crimes of blood. The city is efficiently drained by means of some of the ancient *cloaca* and by modern culverts; intramural burial is no longer practised; the streets are well cleaned; the plumbing is of the best type; slaughter-houses have been abolished and the abattoir substituted; meat, fruit and vegetables are rigidly inspected, and in all respects the sanitation has been so careful that the death rate has been reduced from 30 to 19 in the thousand. The Acqua Marcia (built 140 a.c.; restored 1869) brings water from the Sabine Mountains, a distance of 56 miles. Although strongly impregnated with lime, the water is pure and excellent.

The city is situated on both sides of the Tiber about 16 miles from its contact with the sea, surrounded by the Campagna, the vast prairie stretching from the Mediterranean to

the Alban Mountains and the Sabine Hills, the granary of Rome and the grazing country from which are drawn, in large part, its supplies of meat, milk and butter. Measured by its extent, but a small part of the city is on the right bank of the river. This Transiberine part—in two sections, the Borogo and the Trastevere—extends over the low ground beneath the Vatican Hill, north of the ancient Janiculum. This eminence is crowned by the Vatican, the residence of the popes, the largest palace in the world, containing more than a thousand rooms, halls and chapels, and covering more than 13 acres. The Vatican, the Lateran and the Castello Gandolfo are outside of civic jurisdiction.

South of the Vatican is Saint Peter's, on the site of Caligula's circus, the scene of the torture of Christians by Nero. This chief shrine of Roman Catholicism (described hereafter) is the largest church in the world and occupies nearly four acres. It had its beginning as a basilica erected by Constantine. In the course of its development it came under the creative genius of Michelangelo and received from him its most striking feature, the great dome. Saint Peter's tomb is under the high altar.

The Rome on the right bank of the Tiber is of modern development and is the home of the working class, by speech and appearance somewhat differentiated from the people of the Rome of the left bank. The Tiber enters the city from the north and issues from it at the southwestern base of the Aventine eminence. In its course of three or four miles it is spanned by 11 bridges.

Modern Rome on the left bank occupies the plain anciently known as the Campus Martius, north of the seven hills of the regal and republican city. The Piazza del Popolo is to Rome, in a measure, what the Place de l'Etoile is to Paris. From it radiate great arteries of distribution of the city's out-door throng and traffic. The chief of these is the Corso Umberto I, called simply the Corso, leading, along the western base of the Pincio, to the Capitoline and to a panoramic view of ancient Rome beyond the hill. It is the successor of the ancient Via Lata and is continued north of the city by the Via Flaminia. The Via Ferdinandina di Savoia runs due west from the piazza, crosses the Tiber at the Ponte Margherita (the northernmost bridge within the city) and is continued by the Cola di Rienzi to the Vatican. The Via di Ripetta, passing southward from the Piazza del Popolo, parallels the river and unites with the Via della Scrofa where the Senate sits, in the Palazzo Madama. The Via del Babuino leaves the Piazza del Popolo on the left or east side of the Corso and ends at the Piazza di Spagna and the English quarter, into which the Scala di Spagna descends (137 steps) from the SS. Trinità de' Monti. From this Piazza the Via del Babuino continues to the Quirinal and thence, through a tunnel, to the Esquiline.

The Piazza di Venezia, in which the Corso terminates, is the tramway centre of the city. On the southern side of this square is the imposing monument to Victor Emmanuel II, after designs by the late Count Sacconi, rising in the centre of a colonnaded platform to a height of more than 200 feet. The platform is approached by massive flights of steps. The

monument was a quarter of a century building and cost about 25,000,000 francs. From the Piazza di Venezia the broad Via Nazionale runs a general course northeast between the Quirinal and the Viminal Hills to the Church of Santa Maria degli Angeli, a minute's walk from the railway station (Stazione di Termini), opposite the Baths of Diocletian. In the reverse direction this great street is continued—under the names of the Via del Plebiscito and the Corso Vittorio Emanuele—westward to the Tiber opposite the Villa Barberini. In a fairly accurate way it is the boundary between the area of ancient Rome and that of the modern city on the left bank of the river. Important streets south of this line are the Via Cavour and the Via Alessandrina, which pass the site of the Forum of Vespasian; the Via S. Teodoro (the Vicus Tuscus), traversing the ancient Velabrum; the Via dei Cerchi between the Palatine and Aventine, running through the site of the Circus Maximus, and the Via di Porta S. Sebastiano, touching the tomb of the Scipios and the arch of Drusus, and ending at the ancient gate to the Appian Way. Other important squares and streets: the Piazza Barberini adjacent to the Palace; the Piazza Colonna in the centre of the city, with a column of Marcus Aurelius, and nearby the Piazza di Monti Citoria, on which stand the Chamber of Deputies and other government offices; the Piazza San Pietro with its artistic colonnade, in front of Saint Peter's, and the Vatican; the Piazza di Navona with a fountain and two churches; the Piazza del Campidoglio in front of the Capitol, having the perfect equestrian statue of Marcus Aurelius, celebrated as winning Michelangelo's special regard; the Piazza di S. Agnese, a martyred saint; the Piazza di Navonna, containing the famous statue, a noble Greek work of Pasquino (hence the term "Pasquinades") where for a long time satires of the day, directed against the Pope or nobility and prevalent follies, were posted; the Piazza di Montanari, where from time immemorial peasants contracted with landowners for the season's farm-work; and in the new quarter, embracing the Esquiline, Viminale and a portion of the Pincian Hill, besides the Independence, are the Piazza di Dante, Vittorio Emanuele, Esquilino, Guglielmo Pepe, etc.

Before the railroad was built most travelers entered Rome by the Porta del Popolo, at the northern extremity of the city and but a short distance from the piazza of that name. Those bound for Tuscany depart thence along the Via Flaminia. Just outside is the Villa Borghese, officially styled Villa Umberto Primo since its purchase and transfer to the city as a public park.

The Porta Pinciana is less than a mile east of this gate, and the Porta Pia is a half mile still further on, along the Corso d'Italia. The Via Venti Settembre begins at the Porta Pia, near which the Italian troops entered Rome Sept. 20, 1870, and runs to the heart of the city near the Quirinal. From this gate the Via Nomentana leads across the Anio to Mons Sacer, where the plebeians took refuge during the secession movement which ended in the recognition of popular rights. A mile south is Porta San Lorenzo, the ancient Tiburtina, from which excursions leave Rome for Tivoli.

Along a lane inside the wall, going south across the railroad, one reaches the Porta Maggiore, which was originally an archway in the Acqua Claudia (A.D. 52), which brought water from Subiaco, 42 miles from Rome. Palestrina is reached from the gate over the ancient Praenestina. The Porta S. Giovanni is the gate of departure from Naples, and the Porta S. Sebastiano, the southernmost gate of the city, is the porte of departure for the tombs and other places of interest along the historic Appian Way.

Government.—The government of Rome is administered by a communal council, a municipal council and a syndic. The municipal council is a modified board of public works and the syndic is the administrative chief; both are elected by the communal council from the membership of that body. The syndic is a member of the government. The executive power of the state belongs exclusively to the sovereign and is applied by ministers, of whom there are 13, one without portfolio: The Interior, Foreign Affairs, the Colonies, Justice and Ecclesiastical Affairs, the Treasury, Finance, War, Marine, Public Instruction, Public Works, Agriculture, Industry and Commerce, and Posts and Telegraphs. The legislative authority is the joint concern of king and Parliament. Parliament consists of the Senate and the Chamber of Deputies, the former composed of the princes of the royal house, who are over 21 (they may not vote until they are 25 years of age), and of an unlimited number of members over 40 who are nominated for life by the king. The total membership usually exceeds 400. The House of Deputies has a larger membership, now somewhat more than 500. The number is determined by the population—one deputy to every thousand. The Parliament sits in the Camera de' Deputati, in the Piazza Colonna. The Quirinal Palace is the residence of the royal family and the chief government bureaux are on the Quirinal Hill or near by.

Religion, Churches, etc.—The Roman Catholic Church is in name the ruling religion, but church and clergy are subordinate to the civil government, which guarantees freedom of worship. The law of 1873 abolished the legal status of religious corporations, and they cannot hold property. The revenue from lands destined for charity or schools is now administered by the city, and by each commune; the income from monastic parish church property in Rome belongs to the parish churches, and that from property of foreign religious orders in Rome—about \$80,000—goes to the Holy See. Saint Peter's and its precincts, the Vatican Palace and Saint John Lateran belong to the jurisdiction of the popes. More than 95 per cent of the population of Italy is Catholic. Rome is a city of churches. Any good guide book records more than a hundred as worthy of a visit. Among those of most ancient foundation still in use are Santa Pudenziana, traditionally the oldest, dating from Saint Peter's establishment of a place of worship in the house of Pudens; S. Maria, in Transtevere, founded in the beginning of the 3d century; San Paolo, Fuore le Mura, on the spot where Saint Paul suffered martyrdom, S. Agnese, and S. Lorenzo Fuore, all credited to Constantine. Saint Peter's, of course, ranks first among Roman churches. It

was founded by Constantine on the site of the Circus of Caligula, where Saint Peter suffered martyrdom, and is gorgeously decorated with gold mosaics and marble. Bramante, Raphael, and Michelangelo were the chief architects. Bernini filled it with the sculptures of his contemporaries and many monuments line the pillars and fill niches. The *Pietà* is one of the notable sculptures of Saint Peter's. The great dome is a marvel of architectural skill. The façade is 357 feet long and 144 feet high, and over the central entrance is the loggia, where the Pope is crowned and whence he gives his Easter benediction. Over the main entrance of the vestibule is the celebrated Mosaic of the *Novicella* (1298), by Giotto and Cavallini. The magnificent central door of bronze is a remnant of the old Basilica (1431-39). The enormous size of statues and ornaments in Saint Peter's are deceptive as relates to the vast proportions of its interior, which is only realized by observing the moving, living figures of people. Around the shrine under the dome, 86 gold lamps burn continually. Wonderful mosaic pictures are among the countless gems which enrich this noble temple. Its interior has the form of a Latin cross with chapels on the sides. Many princes of the church lie buried in the crypt. The Vatican, the present residence of the popes, is a vast collection of palaces, comprising the old and new palaces of the popes, the Sistine Chapel, the Loggia and Stanze, the picture gallery, museums and library. Raphael's wall frescoes rank above all his other work, and in the 'School of Athens' and 'Disputa,' the 'Transfiguration,' 'Driving Heliodorus from the Temple,' and other frescoes of the Stanze and Loggia, he evinces astonishing theological wisdom and philosophical erudition. Each stanza attests to his deep reflection and rich imagination; detail and general effect are equally studied, resulting in a perfect harmonious whole. In the Sistine Chapel, the 'Last Judgment' is Michelangelo's chief d'œuvre.

S. Giovanni in Laterano, on a lonely site near the south wall, was built by Constantine, but has since been rebuilt, altered and extended by Giotto and others under various popes, and the high church councils are held there. Other churches are S. Maria Maggiore, in whose construction antique bronzes, gold and marble from pagan temples were largely used, also beautiful mosaics of the 6th century. S. Croce, erected by Saint Helena, the nave of which was borne by eight antique columns; Saint Clemente, the most perfect specimen of old basilica, contains frescoes by Masaccio; Il Gesu, the principal church of the Jesuits, with the façade and cupola by Giacomo della Porta, and whose interior is rich in marbles; S. Maria degli Angeli, originally a part of Diocletian's Baths, transformed into a church by Michelangelo, an imposing church, contains an altar-piece by Muziano, and a fine fresco by Domenichino, and the tomb of Salvator Rosa; S. Maria in Ara Celi, remarkable for its architecture and very old; S. Maria in Cosmedin at the north base of the Aventine, remarkable for its Alexandrine pavement and its lofty and beautiful campanile of the 8th century; S. Maria sopra Minerva, notable as the only Gothic church in Rome; S. Maria in Dominica or della Navicella on the Caclian, with 18 fine columns of granite and two of porphyry, and whose frieze of the

nave was painted in Camiean by Giulio Romano and Perino del Vago; S. Maria della Pace, interesting for its paintings, particularly the four sybils, considered among the most perfect works of Raphael, and S. Maria del Popolo, notable for its sculptures and paintings ('Jonah' by Raphael, ceiling frescoes by Pinturicchio, and mosaics from Raphael's cartoons by Aloisio della Pace). In S. Pietro in Vincoli is the celebrated 'Moses' of Michelangelo, by some critics regarded his best work of sculpture.

The Catacombs are subterranean passages, extending many miles by winding passages underground, used as sepulchres and meeting places by the early Christians; niches in the walls of tufa were used to bury their dead. The passages are narrow, except occasionally when they open into wider spaces used for chapels of worship, and often frescoed. The decoration is characteristic and significant, usually representing Christian hope and doctrine. Pictures are frequently symbolic. A large collection of sarcophagi, pictures and inscriptions from the catacombs, are preserved in the Lateran Museum. The catacombs extend around the city in a wide circle; the most important are the Catacombs of Calixtus on the Via Appia; those of Domitilla or Saints Nereus and Achilles; Saint Prætextatus, Via Appia; Saint Priscilla, beyond the Porta Salaria; Saint Agnese, Via Nomentana; Saint Sebastiano, beneath the church of that name; Saint Alessandro; and the Jewish Catacombs and those of Mithras of the Via Appia. Among the finest sepulchral monuments, the chief were the Mausoleum of Augustus in Campus Martius, and that of Hadrian on the west bank of the Tiber, now the fortress of modern Rome, known as the Castle of San Angelo.

Schools, Libraries, etc.—The state controls public instruction. There are four grades: Elementary; secondary, classical; secondary, technical and higher education. Elementary instruction is provided with religious tuition, if the parent request it; otherwise, without. Great Britain, America, Germany and Austria maintain schools of history, art and archaeology. France's Academy of Art is in the Villa Medici. The University of Rome or Collegio della Sapienza is an ancient institution; canon law and civil law, medicine and philosophy and philology are included in its curriculum. It possesses extensive laboratories, botanical gardens and an astronomical observatory. It is attended by nearly 1,000 students. The Collegio de Propaganda Fide is situated in the Piazza di Spagna; the Collegio Romano, adjacent to Saint Ignazio, is a lyceum, and now contains the Archaeological Museum and the recently established library, Biblioteca Vittorio Emanuele. The Accademia de' San Luca, for the promotion of the fine arts, is composed of painters, sculptors and architects, and was founded in 1595. Connected with it are a picture gallery and schools of fine arts. There are numerous other institutions connected with art, music, science or learning, one of which the Accademia de' Lincei, founded in 1603 by Galileo and his contemporaries, is the earliest scientific society of Italy. The American College, founded about half a century ago, is a school for priests and is composed of students who desire a post-graduate course in divinity, philosophy, rhetoric, metaphysics, etc. The students

enjoy special privileges in the Vatican Library and museums and at all great church functions. There is also an American school of classical studies, under the auspices of the Institute of Archaeology, whose work consists of archaeological research and study, and whose investigations often lead the students as far as Greece or Egypt, accompanied by the faculty. The Irish College is the oldest in Rome.

The Vatican Library—*Biblioteca Apostolica Vaticana*—possesses more than 250,000 volumes and 34,000 manuscripts. Its priceless treasure is the *Codex Vaticanus*, containing all of the Bible as far as Hebrews ix, 14. Scholars regard it as probably the oldest vellum manuscript in existence. The *Codex* was entered in the first catalogue of the library, dated 1475. The most recent significant acquisition was the *Biblioteca Barberiniana*, at a cost of \$100,000. This library is nominally in the charge of a cardinal, but the actual administration is by an under librarian and a prefect. The largest collection—more than 350,000 books and 6,200 manuscripts—is the *Biblioteca Vittorio Emanuele*, in the *Collegio Romano*. It was formed in 1871 of the libraries of the Jesuits and suppressed convents, to which large additions are made annually. The *Biblioteca Alessandrina*, in the *Università della Sapienza*, possesses 160,000 volumes, the *Biblioteca Casanatense*, in the monastery adjoining S. Maria sopra Minerva, 112,000, and the *Biblioteca Angelica*, in Sant'Agostina, 80,000. A half dozen private libraries are open to the public.

Palaces.—It is probably true, as claimed, that Roman palaces are unequaled elsewhere in the world for spaciousness and splendor. Their lofty portals, broad marble stairways, and great halls are matters of wonder. The description by Gibbon applies to-day: "The most costly monuments of elegance and servitude, the perfect arts of architecture, painting and sculpture have been prostituted in their services, and their galleries and gardens decorated with the most precious works of antiquity which taste and vanity have prompted them to collect." The *Palazzo Barberini*, on the Quirinal, was built by Urban VIII, almost wholly from materials taken from ancient buildings. In its small but excellent collection is the 'Beatrice Cenci' by Guido Reni—also valuable manuscript and some literary curiosities; the *Palazzo Colonna* near the centre of the city; the *Palazzo Corsini* in the Trastevere, once the residence of Queen Christina of Sweden, and containing precious manuscripts; the *Palazzo Farnese*, near the Tiber, was inherited by the kings of Naples, but now belongs to the French government, and is occupied by the ambassador. The *Spada Palace* is one of the finest examples of the late Renaissance; the *Palace Rospigliosi*, near the Palace of the Quirinal, contains valuable art treasures. On the ceiling of a casino in its gardens is the beautiful fresco of the 'Aurora' of Guido—this is now the residence of the French Ambassador to the Pope; the *Palazzo di Venezia* is adjacent to the principal Jesuit church, *Il Gesù*. In the *Corso Vittorio Emanuele* is the splendid *Palazzo della Cancelleria*, the single palace in the city which the Pope is permitted to own. On a part of the site of the theatre of Pompey is the *Palazzo Pio*, and southwest of it the fine 16th century *Palazzo Farnese*.

Ancient Rome.—Counseled by the gods, the Greeks conquered Troy. Æneas, carrying his father on his shoulders and leading his son Ascanius, fled, and, guided by his mother Venus, reached Latium. In time Ascanius built a city on a hill, which he called Alba Longa, and his descendants reigned there as kings for 300 years, with all the Latin towns as vassals. But one of his descendants—Procas, king of Alba—dying, left two sons who quarreled over the throne. Amulius, the younger, seized the power, and made his brother Numitor's daughter, Rhea Silvia, a Vestal to avoid the birth of a claimant to the throne. The gods decreed otherwise. She was loved of Mars and bore twins, which Amulius the king ordered to be thrown into the Tiber. They were saved, and suckled by a wolf until they came under the care of Acca Laurentia, wife of the shepherd Faustulus, who reared them. In time they slew the usurping king, placed their grandfather Numitor on the throne, and went away from Alba to build a new city on one of the seven hills by the Tiber. Being twins, neither had the right of primogeniture, and a quarrel ensued over the naming and the governing of the city to be. They left the decision to the sacred birds, and awaited a sign, Romulus (q.v.) on the Palatine Hill and Remus on the Aventine. Remus saw the vultures first—six of them; but Romulus saw 12. Accordingly Romulus built the city, named it Rome for himself, drew a furrow around it with the sacred plow, and beside the furrow built a wall and dug a trench. Remus ridiculed his defenses, and leaped over the wall and the trench to show that the town might easily be taken. Romulus slew him, saying: "So be it with anyone who dares to cross these walls." And so Rome was founded 753 years before the birth of Christ.

These stories of the founding of the Eternal City, once given a certain value as history, Niebuhr, Mommsen and their successors have dismissed to the limbo of myths that have no claim on the credulity of seekers after truth. Even Dionysius (i, 29) reported the skepticism of authorities before his day who claimed that there existed on the Palatine Hill, previous to the time of Romulus, a Sicilian, Pelasgian or Tyrrhenian town whose name was probably Roma. And Microbius (Saturn iii. 9) avers that it was the belief of the Romans themselves that Rome, the city's name, was not Latin and that its Latin name was kept a sacred secret.

Whenever and however Rome had its beginning, its inception was on the Palatine Hill, the centre of a group of eminences of slight elevation on the left bank of the Tiber. The Palatine was not a large stage for so vast a drama of world history as developed there, its circumference being less than a mile and its elevation above the Tiber but little more than a hundred feet. The area of the hill is less than a 20th of that of Central Park, N. Y. It was the home of the Ramnes, who were regarded as the original Romans; a tribe of uncertain origin, but probably of the Opican stock. The form of the so-called city of Romulus—that of a trapezium—forced upon it by the contour of the hill, procured for it the name *Roma Quadrata*. This early city was enclosed by the wall credited to Romulus, which began on the western edge of the Palatine opposite the S. Giorgio in Velabro, ran thence southward in such wise

as to enclose the site of the church of S. Anastasia and the declivity of the valley of the Cerche under the southern slope of the Palatine, along the eastern edge of the Palatine opposite the Cælian Hill, then along the Sacra Via close to the Arch of Titus to the Forum Romanum near S. Marie Liberatrice, and thence to the beginning. Within this enclosure were the temples of the gods and the homes of the patricians; the commons lived beyond the walls with only incidental protection from the fortress within. There was little room for growth. Imperial expansion began with Augustus, who lived in the house of Hortensius until it was burned. Then the Romans, building him a palace worthy of his state—it covered the sites of the houses of Cicero, Hortensius, Catiline and Clodius—really began the "Palace of the Cæsars," which spread over the entire hill, and, before the day of its decline, extended beyond the Romulan wall to two other hills, the Cælian and the Esquiline. Tiberius extended the palace toward the edge of the hill above Velabrum (the riverside marsh), Caligula toward the Forum Romanum, connecting it with the capitol by a bridge, and converted the temple of Castor and Pollux into a vestibule for it. Nero built it toward the Colosseum and filled the valley between the Cælian and the Palatine with the over-grown structure.

The Cælian Hill, southeast of the Palatine, was inhabited by the Luceres, a tribe of supposed Greek origin. It was the site of the Campus Martialis, the playground of Rome whenever the Campus Martius was flooded by the Tiber. It is more than three times the size of the Palatine, and, because it was covered with oaks—a part of which made the sacred wood of the Camenæ—it was known as Mons Querquetulanus. The Cælian figures, in the history of Rome, less than the other hills. Originally the home of a dense population, it was later long given up to the monks of the Camaldolese, Passionist and Redemptorist orders and the Augustinian nuns of the Incoronati. New streets have now been opened and settled.

The Esquiline, "Hill of the Beech," a tree sacred to Jove, is directly north of the Cælian across the ancient Subura. It has two elevations or summits rising from a common plain—one summit, known as the Oppius, now occupied by the churches S. Pietro in Vincoli and S. Martino al Monte, and the other as the Cipius, now the site of S. Mary Major's. It is the largest of the Roman hills. Temples dedicated to Fever (near S. Maria Maggiore), Juno Mephitis (near a malarial pool), and to Venus Libitina for the registration of deaths, bear testimony to the insalubrity of the Esquiline. On the slope behind the Forum was the fashionable quarter called the Carinæ, on the site of the present Via del Colosseo. Near here the Senate sat occasionally in the Temple of Tullius. Pompey's home was here; and near this patrician quarter of the hill was the already mentioned Subura—in the valley formed by the convergence of the Esquiline, the Quirinal and the Viminal—the plebeian quarter, to this day the scene of a crowded population. Virgil lived on the Esquiline, Mæcenas, patron of Augustan poets, had his home where the baths of Titus stood later. To-day only the northern side of the hill is inhabited; the southern is

covered with vineyards and gardens and ruins.

The Capitoline, the smallest of the seven hills, is less than five minutes from the Palatine, in a northwesterly direction. It had but one building devoted to secular affairs, the record office (Tabularium), but many pagan temples. It was the home of Saturn, the predecessor of Jupiter in the city's legendary story, and was called successively Saturnium, Mons Tarpeius and Capitolium, or Mons Capitolinus, the Hill of the Skull. There were two summits; one the citadel or Arx, the other the site of the earliest temple mentioned by any classic author—that of Jupiter Capitolinus, built under Tarquinius Superbus, 535 a.c., with money taken from the Volscians in war. This sumptuous fane had peculiar claims on the veneration of Roman citizens—it was citadel and shrine combined. The Sybilline books were preserved there. There both Titus and Vespasian celebrated their triumph over the fall of Jerusalem. It was later robbed of its treasures during invasions of the Vandals. Near it stood the temple of Fides and the twin temples of Mars and Venus Erycina. The temple of Jupiter Tonans was built by Augustus; the temple of Honor and Virtue by Marius in 103 a.c., with spoils taken in the Cimbric wars. There were still other notable temples, and the Altar of Jupiter Pistor, commemorating the stratagem of the Romans, who threw down loaves into the camp of the besieging Gauls to deceive them as to the state of their supplies. On this hill Petrarch received his laurel crown, and the tribune Rienzi promulgated new laws. Michelangelo designed the present museum and palace of the conservatories. The Museo Capitolino contains one of the finest collections of statuary and painting, and the famous mosaic, Pliny's Doves, found in the ruins of Hadrian's Villa near Tivoli. In "The Reserved Cabinet" stands the exquisite Greek statue Venus of the Capitol, found imured in a wall upon the Quirinal. In the Hall of the Emperors is the imposing seated statue of Agrippina (grand-daughter of Augustus) and 83 busts of Roman emperors, empresses and their families, a character study. The Hall of Illustrious Men is interesting, as is also the Hall of the Faun, from the Faun found at Hadrian's Villa. The statue of the Faun is highly graceful and artistic. The three gems of the collection are found in the Hall of the Dying Gladiator,—the Dying Gladiator, the Antinous of the Capitol and the Faun of Praxiteles. The Palace of the Conservatories contains busts of artists by Canova, the restoration of a column of Michelangelo, many fine frescoes and reliefs by Bernini and other masters; the Apollo Belvedere and the famous Bronze Wolf of the Capitol, of unknown antiquity. Near the wolf is the well-known and beautiful figure of the boy extracting a thorn from his foot. The Picture Gallery of the Capitol contains few good works: a beautiful Saint Sebastian by Guido and several others by Guercino.

The Capitoline was the seat of administration—the Capitol. State acts, deeds, documents, etc., were advertised there by hanging or "posting" copies, engraved on bronze, on a statue or shrine.

The Quirinal, the northernmost of the seven summits, is a long narrow eminence beginning at the Forum of Trajan, at the base of the Capitoline and stretches northeastward toward

the Porta Pia. It was the site of the Temple Janus Quirinus (a Sabine god) surrounded by a sacred grove. Here Martial, the epigrammatist, lived in a third floor apartment in a narrow street and greater folk had their palaces—the Flavii and the Corneli—at some number in the Vicus Corneliurum. In Trajan's time the Quirinal was joined to the Capitoline by a steep, high ridge which sloped to the Forum Romanum on the southeastern side and to the Campus Martius in the opposite direction. Trajan cut it away. The building of chief importance on this hill is the Quirinal Palace erected to be a summer residence of the popes. It is now the palace of the king.

The Viminal, like the Esquiline, was outside the Servian wall, adjacent to the Quirinal and in appearance a part of it, except when viewed from near S. Maria Maggiore. It extends to the Esquiline and gets its name from the water willows (*vimina*) once abundant there. The line of separation between the bases of the Quirinal and the Viminal was marked by the massive Tower of Nero (the Torre Milizie) and the walls of the Forum of Augustus. The most striking remains on the Viminal are the ruins of the Baths of Diocletian near the railway station. The great baths of Thermæ were peculiar features of the city and were used not only for bathing purposes, but for games and athletic sports and contained assembly rooms, libraries, promenades, etc. The thermæ of Caracalla, Titus and Diocletian were the most magnificent and largest.

The Aventine Hill takes its rise from where the old Sublician bridge spanned the Tiber and extends to the Circus Maximus, which separated it from the Palatine. The name was derived from King Aventinus Silvius, according to the most credited but still disputed etymology. It is the highest and most picturesque of the hills. The Roman home of Saint Paul's friend Aquila was on the Aventine and overlooked the Circus Maximus. Here, tradition says, Peter and Paul taught the Christian faith in an oratory discovered in 1776 near the present church of S. Prisca. Aquila and Priscilla were buried in the cemetery of Priscilla, which was also the burial place of Pudens, whose house was on the southern slope of the Viminal, where its remains were discovered in 1870. The *Liber Pontificalis* confirms the tradition that pieces of furniture used by Saint Peter were long preserved in the house and church of Pudens.

There were other hills of profound interest to students of the history of the imperial city. The Janiculum was the chief of these, rising abruptly on the right bank of the Tiber and declining gently into the Campagna in the direction of Civita Vecchia, the ancient Centum Vellæ. Ancus Marcius, fourth of the Roman kings, connected it with the rest of the city by means of the Pons Sublicius, the first bridge over the Tiber and the scene of the defense of Rome by Horatius Cocles, who kept the bridge against Tarquinius Superbus and his Etrurian ally, Lars Porsena.

The Ramnes settled the Palatine, the Luceres the Cælian and the Sabines all the other eminences. These tribes were the three chief racial ingredients of the Roman people. The Servian wall enclosed all these hills except the

Esquiline, the Viminal and the Janiculum. The Aurelian was built to extend still further the defenses of Rome, then threatened by the northern tribes. The menace of the Goths was responsible for the purpose to enclose not only the city proper, but a part of the suburbs beyond the Tiber, as a military necessity. The suburbs were at the mercy of the barbarians who had already overspread whole provinces and devastated as far as Rome, which had now descended its hills to the unenclosed Campus Martius. Aurelian, with the support of the senate, commenced the wall which bears his name in 271. The *Einsiedeln Manuscript* (9th century) enumerates 383 towers, some of which remained until near the end of the last century, notably near the site of the Ludovisi Gardens. It also records the names of the 14 gates in this wall, of which six are in use now: Porta Flaminia, now Porta del Popolo; Porta S. Lorenzo (the ancient P. Tiburtina), Porta Maggiore (P. Praenestina), Porta S. Sebastiano (P. Appia), Porta G. Paolo (P. Ostiensis); on the Janiculum, Porta Aurelia. These gates, which disclose the course of the wall, date generally from the time of Honorius (379-395).

The population of ancient Rome has been estimated in several ways—by the extent of the area within the city wall, by the amount of corn consumed in a year, by the number of habitations, etc. What the area was is uncertain, the extent of the walls being a matter of controversy. In the Augustan period, at the beginning of our era, the consumption of corn—60,000,000 bushels in a year—indicated a population of 1,950,000. To have housed this number—allowing 40 persons to the house—would have required 48,750 habitations; but of the actual number of domiciles at this time there is no record. Four hundred years later, in the reign of Theodosius (395-425), we have the first record of the kind, 48,382 houses. Juvenal advised the poor to emigrate from the miserable, dark lodgings, the smoke and other hardships of the city to better homes at the same price in the Italian villages. Houses were built to dangerous heights in order to accommodate the body of the Roman people and the estimate of 40 persons to each habitation may not be too large. The fact that there were no more houses in Rome at the end of the 4th century than there were at the beginning of the first should be pondered in the light of the sharp fluctuations of population which, for one reason and another, took place in the early centuries of the Christian era. Merivale's guess at the population was 300,000, Dureau Lamalle's 500,000, Gibbon's 1,200,000 and Donovan's 1,950,000. For an interesting discussion of Roman population, consult Story, 'Roba di Roma,' ch. xxi.

Public edifices rather than private, life in public in preference to domestic pursuits in the home, were bent characteristic of the Roman genius which developed a political system of collectivism—centralization, state initiative and domination. The Athenian emphasis on the individual was reversed in Rome. There the unit counted for nothing; the utilities were for the populace. Under this system a wonderful city came into being, the greatest instrument of popular service that was created before the Christian era. At the beginning of the 4th

century there were in Rome, 18 public fora, 30 parks and gardens and 8 campi or commons principally used for athletics. To these are to be added the covered ways which sheltered the people from sun and rain, the colonnades and temples which served them in many ways and the public baths for their refreshment—11 large ones and 926 small, capable of receiving 60,000 bathers at one time. Noteworthy among these were the baths of Agrippa, with the celebrated Pantheon (q.v.), the "temple to all the gods," adjacent. Through all these utilities and many others the currents of Roman life ran from century to century of development—a well-balanced life, expanding constructively and making Rome indeed eternal, and, Jerusalem excepted, the most interesting spot on the globe.

In the fora—the kind called *venalia*—they trafficked in cattle, corn, fish; in the *fora judicialia* brokers and money-lenders pursued their calling in offices in the porticoes and buildings which enclosed them. The great forum—not the largest, but called the Forum Romanum Magnum—was built between the Palatine and the Capitoline hills. Before its founding this valley was a small lake, with a ferry; later, a morass with its wet and dry seasons—in the latter the scene of occasional battles between denizens of the surrounding hills—and finally ideally prepared for its future use by drainage accomplished through the great sewer, Cloaca Maxima, discovered in 1872. The Forum first became useful in the 6th century B.C., as the community assembling place, serving more amply than the area Capitolina which had previously been used. In view of its august history one learns with surprise how small its area was. "We say to ourselves, is it possible the Roman world, even of Cæsar's time, could have transacted its business in such restricted limits?" Its greatest length at any time, antiquarians agree, did not exceed 671 feet, its greatest width (under the Capitol) 202 and its least 117, at its eastern end. Under the empire it was but 375 feet long and 150 feet wide at the Capitoline end. It was habitually so encroached upon by the statues and monuments that the senate from time to time required it to be cleared. Lucius Æmilius Paulus, with a part of the spoils of the Gallic War, purchased adjacent property and enlarged the forum on the northern side. Cæsar, drawing on the same fund, bought more space, removed houses north and west of the Curia and gave Rome the Forum Julium. Augustus extended the area northward and Vespasian, Domitian and Nerva, each as he came upon the scene, enlarged eastward until the Forum Transitorium and the Forum Pacis were created. Trajan cut away a spur of the Quirinal on the northwest side of the Forum of Augustus and completed the development projected by Paulus and Cæsar with the vast Trajan or Ulpian Forum. "Could we from some vantage point look down and survey all these imperial fora, together with their original parent, the one forum alone now completely exposed for us, that surprise above adverted to would not partake of the nature of a disappointment. . . . We should survey a space covering many thousands of square yards, amazingly rich with temples, basilicas and columns, white with dazzling marbles and white-robed people, golden with gilt bronze statues,

and here and there beautifully green with favored and sacred trees and flowers." (Baddedeley).

On the east side of the Forum, Tullius Hostilius enclosed a space called the Curia, in which the senators, representing patrician Rome, held their meetings; in front of it, in another enclosure, the Comitium, the plebeian vote was polled. From the senate house a flight of steps led to that part of the Comitium where the Rostra stood, from a near-by platform of which foreign ambassadors (Greek) listened to orators in the Rostra and speakers in the Comitium. The Rostra was a simple platform, under an arcade, to which the bronze beaks (*rostra*) taken from captured vessels were attached.

The Forum was connected with the Summa Sacra Via (the ridge between the Colosseum and the Forum) by a short lane which was the original Sacra Via, whose name was then extended to the entire length of the road from the Capitol to the Esquiline Hill. Baddedeley conjectures that it originated in a path leading to the sacred Capanne, or primitive temples and the cemetery above the marsh wherein the "prisci Latini," "Sabini," and their forbears interred their kindred. Varro says the Sacra Via, at its eastern end, originated in the Sacellum Streniae whose site is now unknown; eventually it was extended to the Clivus Capitolinus. "From this long track duly developed the rich Republican street lined with temples and houses, descending from the Velia [the north point of the Palatine] so as to skirt the northern flank of the Regia and then lose itself beside the open Forum. . . . Its conditions, like those of the historic buildings on it, kept on improving until the time of Nero; and from having been a simple path to the place of the ancestral dead, it survived to celebrate for centuries the proudest triumphs of the living." Then Nero appropriated the Velian Ridge and built across it, from the Palatine to the Esquiline, his House of Gold. By this time (A.D. 121) the trade centre of Rome had moved from the imperial fora to the Forum Pacis and the Forum Transitorium, relieving the Sacra Via of the noisy throng going to and from the Colosseum; and the Triumphs—out-door displays of great magnificence—thereafter passed more conveniently through the Forum Pacis and thence into the lower Forum Romanum.

Two other streets—Vicus Jugarius and Vicus Tuscus—were important features of the environs of the great forum. Both originated in the unknown street which lay along the south side of the Forum; the Jugarius at the western end of the Basilica Julia, and running close under the Capitoline to the Porta Carmentalis, near the Theatre of Marcellus. At its entrance into the Forum was the fountain Lacus Servilius where were exposed the heads of senators assassinated during the proscriptions of Sulla. The Vicus Tuscus ran along the eastern end of the Basilica Julia, through the Velabrum to the Circus Maximus. It was a busy shopping street where almost everything was sold from the finest silks, frankincense and perfumes to fruits, vegetables and fish. Festal pageants moved along it from the Forum to the circus. On one side of the Forum stood the Tabernæ Argentariæ, silversmiths'

shops, and in front of S. Adriano, beyond the Tabernæ Novæ, Virginia was stabbed by her father. The front of S. Adriano is a fragment of the Basilica of Æmilius Paulus. This Basilica occupied the site of the famous Curia of Tullus Hostilius. The three gigantic arches are all that remain of the Basilica of Constantine. Little remains of the once superb temple of Venus and Rome, except a cella, countless fragments of columns, and a mass of Corinthian cornice facing the Colosseum. This was the last pagan temple which remained in use in Rome. Near the church of Saint Francesca the Sacra Via passes under the Arch of Titus, the most beautiful monument of its kind remaining in Rome, erected by the senate to commemorate the taking of Jerusalem. Of the original erection of 81 A.D. only the central part of the arch remains; the sides were restored as late as 1823. The triumphal procession of Titus occupies two reliefs on the inner sides of the jambs of the arch. The chariot bearing the conqueror is drawn by horses led by the goddess Roma. Victory holds a crown above his head, and Lictors surround him, while the procession passes under the triumphal arch. On the opposite jamb a relief displays the spoils of the Temple of Solomon—the table for the shew-bread, the seven-branched candlestick and the golden trumpets. The apotheosis of Titus—the emperor ascending, borne by an eagle—is represented on the soffit of the arch, while the friezes carry sacrificial scenes. The doings that made the fame of Titus won for him the abhorrence of the Jews, and to this day hatred of him is a part of the creed of that race, which will never forget that captives from Jerusalem marched in chains in the procession of their conquerors, slaved (12,000 of them) in the building of the Colosseum and were forced to lay the stones in the foundation of this very arch, beneath which, it is said, no Jew who respects his religion and racial traditions has ever passed willingly. Vespasian exacted from the Jews the same tribute which they had given to the Temple, and Domitian, who erected the arch, drove them out of Rome, from which they remained exiled until Alexander Severus extended amnesty and permitted them to return to the Ghetto.

The best preserved triumphal arch remaining in the Eternal City is the Constantine, by the Colosseum, which has been accepted as finished in 315, when Roman art was at low tide. The beauty of its lines and the wealth of its decorations have been accounted for by refusing to credit the conception and achievement to that time and claiming that the reliefs and other decorations were taken from an arch erected by Trajan as an entrance to his Forum two centuries before. Recently the fact that it was built by Constantine has been challenged, and the claim set up that it was one of the arches by Domitian rehabilitated after its despoilment by the senate's decree of *Memoria damnatio* pronounced against the murdered emperor.

The Romans imitated the Greeks in many things but not in their abandonment of human sacrifice, which was a part of the festivities at the funerals of the great. From simpler arenas these events were transferred to the market places, the first to the Forum Boarium, 264 B.C. For a long time the Forum Romanum was one

of the most popular stages for these bloody shows. The Colosseum succeeded it. The Colosseum was the conception and the achievement of the Flavian emperors: Vespasian began it, Titus advanced it and Domitian completed it. Vespasian came from the people; looked to them for popularity and support and built this, the first considerable edifice for the public since the time of Augustus, for the use of the classes. It was in the heart of Rome, a short distance from the Capitol, adjacent to the palaces of the Cæsars. About it surged the high tide of Roman life. It was massive, architecturally purely Latin, of perfect arrangement for popular uses and altogether typically Roman. The three lower stories of the four were built with 80 arches supported by piers, faced with half columns. The fourth was a solid wall faced with pilasters. The first story is Doric, the second Ionic, the third Corinthian and the fourth composite. There was a statue for each of the arches of the second and third floors. The capacity of the building was 50,000 persons; a tier of seats for each external story. Hard by the arena was a marble platform with marble thrones for the Vestals, senators and other dignitaries. Above this platform was the emperor's throne, under a canopy. The emperor entered from the Cælian or the Esquiline, from each of which there was an approach to the throne. There were marble steps above the platform, every second one forming a row of numbered seats, admission to them being by ticket, whose issue was governed by special laws as to the classes eligible to receive them. Above these seats a wall separated them from those still further up. To the topmost seats the women and the lower classes were admitted to see the homicides that made their holiday. The human slaughtering went on throughout the day. Such was pagan Rome a century after the dawn of Christianity. Such indeed it continued, though slowly diminishing in thirst for blood, until Justinian, in the sixth century, put an end to its preying on human victims.

Romulus in his feasts in honor of Neptune—so runs the legend—introduced the most ancient of all Roman spectacles, the circus. Crediting this popular form of amusement to the mythical founder of Rome means that its origin antedates authentic history. No building dedicated to the sport of chariot and other horse races, and called a circus, is known to have existed before the time of the elder Tarquin—about 616 B.C. The Romulan Circus, afterward known as the Circus Maximus, was in the valley between the Palatine and the Aventine, and was the only one in Rome for nearly 400 years. The Flaminian, constructed in 212 B.C., was the second, and the Flora came next, the gift of a noted courtesan. The wealthy and powerful then began to attach circuses to their establishments—Sallust, between the Quirinal and the Pincian, Caligula in the Vatican gardens, Heliogabalus in the Varian gardens, and Alexander Severus in his grounds. It was a subject of satirical comment that Rome possessed nine circuses and only three theatres and three amphitheatres. The most celebrated theatres were those of Pompey, Cornelius Balbus and Marcellus. Pompey's was adorned with beautiful statuary. It held 40,000 persons.

The games in the circus, and indeed all games,

the Romans regarded as religious manifestations, and they were accordingly preceded by so-called religious ceremonies. When the Circus Maximus was the scene, the *Pompa Circensis* commenced at the Capitol and proceeded by the Forum. It was opened by boys afoot and on horseback, followed by charioteers, horsemen and almost naked athletes, and by three classes of dancers—boys, beardless youths and young men, who moved through the Pyrrhic dance to the sound of the lute and the lyre. Others bore altars and burned perfumes upon them, and still others carried images of gods and demigods and sacred vases and utensils. Entering the circus by the central gate of the Carceres, the *Porta ad Pompam*, the pomp moved around the circus, and, after offering sacrifices at the first goals and at the altar of the Consus, each person who had had a part in the sacrifice took his place in the games.

The Roman theatre was of early origin. The dramatic representations, like the games in the circus and the amphitheatre, were religious. As early as 114 a.c. the Censors Massala and Cassius desired to erect a permanent theatre, but were not permitted to do so for fear that the morals of the people would suffer. The first plays were given *al fresco*, and then in wooden structures without seats, the senate having decreed against seats in order that "the manly habit of standing, combined with mental relaxation, might be the peculiar mark of the Roman people." A century after Massala and Cassius were refused a permit, a permanent theatre was erected by Pompey. As a peace-offering to the many who still regarded permanent theatres as immoral agencies he erected on the top of his temple to Venus Vincitrix, "thus," as Tertullian conceived, "screening a censurable project under the veil of religion."

The Roman religion was a vast symbolism of things seen and of qualities apprehended. The gods representing conceptions of physical phenomena were characteristically Latin. The oldest document which has come down from Roman antiquity—the *Calendar of the Roman Community*—is filled with the festivals of the gods and goddesses of germination, of seed sowing, harvest, the granary, protection of vines and vats, the shepherds, the fecundation of flocks, etc. The Roman desired the partnership of his gods in his every-day employments, to promote increase of substance by whatever means he resorted to, whether in the keeping of flocks, seafaring or commerce. There were innumerable deities for the field, the forest and the stream, and 12 great gods—Mars, Jupiter, Juno, Vesta, Minerva, Mercury, Ceres, Venus, Neptune, Vulcan, Apollo and Diana. The greatest of these was Mars, the god of killing, the divine hurler of the spear and the protector of Roman life and substance. It was a religion devoid of morality and moral purposes, and rose no higher than the sphere of business and, eventually, under Greek influence, of physical and intellectual pleasure. "As the Romans saw gods everywhere; as all nature—sky, earth and water—was to them full of divinities who watched over human beings with benevolent or jealous eyes, there was no act of life which did not require a prayer or an offering, a sacrifice or a purification, according to the rights prescribed by the

ministers of religion. This piety, being the offspring of fear, was all the more attentive in observing signs considered favorable or the reverse; so that everything depended on religion—private life, from the cradle to the tomb; public life from the comitia to the field of battle; even business and pleasure. Games and races were celebrated in honor of the gods; the people's songs were hymns; their dances a prayer; their music uncouth but sacred harmonies; and, as in the Middle Ages, the earliest dramas were pious mysteries. By the continual intervention of the pontiffs, who knew the necessary rites and sacred formulæ, by that of augurs, aruspices and all the interpreters of omens, this religion, devoid of dogmas and of clergy, of ideal and of love, was yet a great force of cohesion for the state and a powerful discipline for the citizen." (Duruy).

While there was no clergy there were priesthoods, the most ancient bearing relation to Mars. But those who desired anything of the gods made their prayer to them and not to the priests. This was not always a simple matter, and the habit of consulting men of skill—not mere altar menials—resulted in two so-called colleges or corporations: the augurs and the pontifices. The former—six in number—interpreted the language of the gods from the flight of birds; the latter, five engineers, derived their name (pontifices, bridge-builders) from their profession, managed the calendar of the state and saw that every religious and judicial function was performed on the right day.

Temples, unknown in the earliest Roman worship, came to hold a large place in the life of the city, and were probably the first public buildings in time and importance. There were eight types; the *ædes*, a sacred edifice with prescribed parts; the *templum*, an open space or edifice consecrated by the augurs; the *fanum*, a plot of ground consecrated by the pontiff; the *dulubrum*, an edifice consecrated to several divinities; the *tesca*, for the deities of a desert place; the *ædicula*, a little temple apart; the *sacellum*, a roofed or unroofed cella containing the statue of its divinity, and the *lucus*, a sacred grove.

Paganism was leaving its wonted temples and fanes and the Christian religion was entering. Rodolfo Lanciani, after 25 years of active exploration of ancient Rome, by excavation and otherwise, declared that every pagan building that was capable of giving shelter to a congregation was transformed, at one time or another, into a church or a chapel, and that patient investigation of the ruins of such edifices always disclosed traces of the work of the Christians, as in the faint delineation of the Saviour and the four saints in the temple of the Sybil at Tivoli and the diminutive figure of Christ on the Cross in one of the flutings of a column in the temple of Neptune. There were discernible remains of religious painting in the apse of the Basilica of Constantine disclosed by the excavations in 1828. The same excellent authority bears testimony to the great number of churches, there seeming to be, at one period, more of them than of habitations. Saint Paul could have said in the Eternal City that the Romans were in all things religious, whether they were of the pagan ages or the succeeding

Christian era. It requires centuries for the spiritual development that gave Rome its religious supremacy through the powerful agency of the Roman Catholic Church.

Recent excavations have thrown considerable light on the subterranean galleries connected with the games held in the time of Cæsar in the Forum. It is clear that 12 elevators were used to deposit quickly the various parties of combatants. Equestrian statues were later placed above them. The square basement of Janus Medius, wells containing fragments of pottery, graves, containing chalices, have also been discovered. Under the substructure, narrow prison cells have come to light. At the foot of the Palatine were revealed the remains of an imperial palace, later transformed into a Christian sepulchre; also some prehistoric tombs. The ancient graffiti—that is the rough sketch or misspelled word scratched upon walls or columns by early Christians and thoughtless idlers—have solved many topographical problems of the ancient monuments of the "Eternal City."

History.—The entire period from the date of the foundation of the city, 753 B.C., to the establishment of the republic, 509 B.C., is in its detailed history unknown to us, and from the mass of myth and legend it is possible to derive the very broadest conceptions only of the beginnings of the Roman state. This is due to the fact that the authentic records of Rome date only from 390 B.C., the year of the destruction of the city by the Gauls. Tradition, then, speaks of seven kings who, including Romulus, ruled over the city for 243 years and assigns to each definite services rendered to the state. Romulus was the founder and conqueror; his successor, Numa Pompilius, was a religious teacher; Servius Tullius, a political reformer and law-giver, etc. The last three kings, Tarquinius Priscus, Servius Tullius and Lucius Tarquinius Superbus, were of Etruscan origin, whereas the earlier rulers had come from Latin stock. With the overthrow of Tarquinius Superbus in 510 the Roman kingship comes to an end. A critical study of this legendary period makes all these names and the events connected with them doubtful, but preserves the general outline of development. Rome, in the modern view, is regarded as having had its origin in the union of three tribes, the so-called Ramnes, Tities and Luceres, of whom the first were of Latin blood, the second of Sabine stock and the third of doubtful affinity. The situation of Rome on the hills near the mouth of the Tiber was favorable for its development, and in the course of time the city extended its authority over the neighboring country until with the destruction of Alba Longa, the ancient religious centre of the Latin peoples, it came to assume a predominant position in Latium. The Etruscan character ascribed to the last three kings points to an Etruscan conquest, and indeed throughout the early period of Rome the influence of the Etruscans to the north is marked, especially in religious customs and in architecture. From the very earliest period the inhabitants of Rome appear to have been divided into two classes, the patricians and the plebeians or *plebs*, with whom probably may be ranked the class of *clients*. It was the patricians alone that constituted the state; the *plebs* had no political rights whatsoever. In fact early Rome should

be regarded as consisting of two isolated communities, one comprising the original settlers or, possibly, the conquerors of the city, the other the conquered population and later immigrants, such as those attracted to Rome by the excellent opportunities for trade it offered. Not only was the political power in the hands of the patricians, but even the early Roman religion was largely in the nature of a narrow national creed to which the *plebs* could not be admitted. Intermarriage between members of the *populus* and *plebeians* was forbidden. The patricians alone had the right to bear arms. Within the *populus* or state, the headship was vested in the *rex* or king, who combined in himself the functions of war leader, judge and priest, and was assisted by a council of elders or senate. The Roman "people" were divided into wards, class or *gens*, and households. When assembled for the exercise of its sovereign powers it was known as the *comitia curiata*. A change in the relations between patricians and *plebs* was effected by a reform which legend ascribes to Servius Tullius. By this innovation the right of bearing arms was conferred on the *plebs*, and the entire free-holding Roman community was divided into five classes, on the basis of wealth. These classes were subdivided into centuries or "hundreds," and the entire military assembly of the inhabitants bore the name of *comitia centuriata*, which, instituted undoubtedly for purposes of national defense, soon came to exercise important political powers.

The expulsion of Tarquin was followed by long wars with the Etruscans and the Latin tribes, in the course of which Rome for a time had to contend for its existence. A great victory over the Latins in 496 led to the formation of a Latin Confederacy under the leadership of Rome. Thus strengthened the Romans fought successfully against the Æqui, the Volsci and the Sabines, and in 396 captured the Etruscan stronghold of Veii, which was followed by the subjugation of southern Etruria.

The place of the kings was taken after 509 by two consuls, elected by the *comitia centuriata* from the ranks of the patricians. The institution of the senate was retained and plebeians were admitted to membership, but all magisterial offices were closed to members of that order. The period that follows, therefore, is marked by a bitter struggle on the part of the plebeians for political and, to a degree, social equality. Wealth, too, became concentrated in the hands of the patricians and the distribution of the public lands was carried on entirely in the interests of the ruling class. Discontent was also fostered by the severity of the laws against debtors. In 494 the plebeian army, just returned from a victorious campaign, seceded to the Sacred Mount, near Rome, and threatened to found a city for themselves unless concessions were made. The patricians yielded and the office of tribune of the *plebs* was created for the defense of the interests of the lower order against the ruling class. These tribunes, originally two in number, later increased to 10, were given the right of veto on the decisions of the consuls and the senate. In the course of the struggle for an equitable division of the public land, Spurius Cassius, a patrician who espoused the cause of the *plebs*, fell a victim to the vengeance of his caste (486 B.C.). The demand for a codification of the laws led to the

appointment in 451 of 10 decemvirs who after two years' work brought forth the Twelve Tables in which the entire system of public and private law was embodied. The act of violence attempted by Appius Claudius, head of the decemvirs, on the plebeian maiden Virginia led to the overthrow of the decemvirs in 449 a.c. Protected now against the arbitrary misuse of the law on the part of the patricians, the plebeians pursued with renewed strength the struggle for political and social equality. In 445 intermarriage between patricians and plebeians was made legally valid. The consuls were supplanted by military tribunes with consular power who might be chosen from among the plebeians. After this the plebeian conquest of offices proceeded steadily. The quaestorship was gained in 421 a.c., the dictatorship in 356 a.c., the censorship in 351, the praetorship in 337. After a 10 years' struggle it was provided by the so-called Licinian Rogations (367 a.c.) that no citizen should own more than 500 *jugera* of the public domain that the remainder should be distributed among the *plebs* in small allotments. The consulship was also restored and it was made obligatory for one consul to be chosen from the *plebs*. By the year 300 complete equality between the orders had been established. The termination of the contest between the two orders may be assigned to the year 286 a.c., when the Hortensian Law made any decree of the *Comitia Tributa*, wherein the *plebs* were predominant, law for the whole people, the so-called *plebiscite*.

The course of political progress during this period was sharply interrupted by the invasion of the Gauls who in 390 overwhelmed a Roman army on the Allia, burned the city and besieged the garrison in the Capitol. Legend ascribes the defeat of the Gauls to Camillus (q.v.), but in reality it was a large ransom in gold which induced the conquerors to retreat. The devoted patriotism of its citizens, however, restored the fortunes of the city; its houses were rebuilt, the attacks of the neighboring peoples, the Volsci, the Aequi and part of the Latini were repulsed, and within a short time Rome had more than regained its former power. With the establishment of internal peace, its career of rapid conquest begins. The Samnites, the most formidable rivals of the Romans, were defeated in three great wars (343-341, 326-304, 298-290) in the course of which Rome contended successfully against the united forces of the peoples of central Italy, aided in the last of the wars by the Gauls. A rebellion of the Latins was crushed in 338, the long struggle terminated in the complete subjection of the allies, and the inhabitants of Samnium, Picenum, Umbria, Apulia, Lucania and Etruria became the allies of Rome. In 280 war broke out with Tarentum, the most powerful of the Greek cities in southern Italy. Tarentum called Pyrrhus (q.v.), king of Epirus, to its aid. Subjected at first to defeat, the Romans ultimately drove Pyrrhus from Italy and took Tarentum (272). Rome was now mistress of central and southern Italy and had fought with success against the Gauls in the north. To make conquest permanent military colonies were planted in the subjugated territories and a great system of public highways was developed to facilitate communications. The incessant wars had made Rome a nation of soldiers, and now that there

was no one to resist it in Italy, it turned its arms against a foreign power, and in the struggle with Carthage made the first beginning of its imperial career.

The early relations between Rome and Carthage were friendly and commercial treaties between the two nations had been concluded at various times. The contest between the two broke out in Sicily, of which the Carthaginians were masters in greater part. The first Punic War (264-241 a.c.) began with the invasion of Sicily by a Roman army. The strength of Carthage, however, was on the sea, and to cope with it, the Romans built a fleet with which in 260 they gained a great victory at Mycalæ. The fortunes of the war wavered for a long time until a second victory off the Ægæan Islands in 241 brought Carthage to terms. Sicily was surrendered to the Romans who erected it into their first province, and Carthage pledged itself not to wage war on the allies of Rome. In 238 the Romans seized Sardinia and in the following year extended their sway over the Illyrian coastlands and upper Italy. Carthage, robbed of its island possessions in the Mediterranean, more than made up its losses in Spain, and in 218 a.c. the celebrated Hannibal (q.v.), son of Hamilcar Barca, the conqueror of the peninsula, renewed the contest with Rome (the second Punic War) by his attack on Saguntum, a city ally of Rome. Hannibal invaded Italy (218 a.c.), defeated the Romans at Trebbia on Lake Trasimene the following year, and in 216 a.c. at Cannæ thoroughly completed the rout of the Romans. Rome, however, remained steadfast with Hannibal at its very gates, husbanded its resources and by carrying the war into Africa forced Hannibal to depart from Italy. In 202 the Carthaginian general was defeated by P. Cornelius Scipio at Zama, and Carthage signed peace giving up Spain to the Romans, dismantling its navy and paying an indemnity of 10,000 talents. The hatred of Rome, however, was not appeased, and when Carthage, after 50 years, showed signs of renewed strength, it was attacked and destroyed (146), after a siege of three years (the third Punic War). The Roman arms in the meantime had also conquered the East. Antiochus III of Syria was defeated in 190 at Sipylus and deprived of his possessions in Asia Minor. Macedonia, after repeated wars, was made a Roman province in 146, and Greece, which had enjoyed the shadow of freedom for 50 years, was reduced to the same condition, in the same year, under the name of Achaia, after Corinth, its most prosperous city, had been stormed and robbed of its art treasures. In 133 Rome fell heir to the dominions of Attalus, king of Pergamus, and the Province of Asia was formed out of the territories thus acquired. The Roman rule in the Spanish peninsula was firmly established after two formidable insurrections, one led by Viriathus (148-140) and the other known as the Numantine War (143-133), had been suppressed.

Republican Rome was now at the height of its power, but the wars which had been crowned with such success abroad brought on evils within the state which were destined to destroy it. The task of governing a world empire and carrying on the great game of diplomacy by which that empire had in large measure been built up, naturally called for a more centralized and rapid exercise of authority than was possible

with the cumbrous methods of the popular *comitia*. The power of the state gradually passed into the hands of the senate. There grew up at the same time a nobility of the robe, consisting of those who had enriched themselves as rulers of the newly conquered provinces which Rome for a long time regarded as subject territories merely and as fruitful sources of revenue. So wealthy had the state become, indeed, that in the second half of the 2d century B.C. the citizens of Rome were freed from all burdens of taxation, a measure which attracted to Rome a large population of idlers, which derived its chief sustenance from the largesses of the nobles who found it necessary to court the favor of the mob. Throughout Italy the rich Roman office holders established vast landed estates, which were fast coming to be worked by slaves, and the poor farmers, ruined by this formidable competition, came in great numbers to Rome to swell the ranks of the propertyless. Between this great mass of poor proletarians and the small class of officials, senators and landlords, strife was in the nature of things bound to come, and it was this strife between the *Optimates* or the aristocratic party and the *Populares* or proletarians that, skillfully used by ambitious politicians, brought about the fall of the republic. Nobles of the popular champions were the brothers Tiberius and Caius Gracchus (q.v.) who wrested from the senatorial party an agrarian law favorable to the homeless masses and regained some of the ancient powers of the popular assemblies, but fell victims both to the hatred of their enemies (133 and 121). The war against Jugurtha (q.v.), which revealed the shameless corruption to which the ruling party had sunk, brought forth another popular leader in Marius (q.v.) whose reputation was increased by the splendid victories over the Cimbri and the Teutones in the years 102-101. Moderate at first in his views, Marius was driven, by the agitations of demagogues, to violence. In 90 B.C. the Italians rose in insurrection to enforce their demand for the rights of Roman citizenship, and though the allies were defeated it was deemed expedient to grant them their demands. The termination of this struggle, known as the Social War, in 88 B.C., was followed by a conflict between Marius and Sulla (q.v.), an adherent of the senatorial party, for control in the state, in the course of which both factions were guilty of dreadful excesses. In the year 81 the Marian party was finally overthrown and Sulla, proclaimed dictator, enthroned himself in power by a bloody proscription of his enemies, and proceeded to revolutionize the constitution of the state so as to place the sole power in the hands of the senate and the aristocratic party. But neither senate nor people was thenceforth to govern in Rome. The example of aristocratic rule based on military force had been set by Sulla and the struggle between parties now passed into a struggle between individuals for control. Gnaeus Pompeius by his victories over Sertorius in Spain and the suppression of the servile insurrection under Spartacus attained immense popularity and this was increased by his readiness to make concessions to popular demands. After his triumphant campaigns against the Mediterranean pirates and Mithridates (q.v.) he was for a time master

of Rome. The senate, however, stirred to an assertion of its rights by its successful course in the conspiracy of Catiline (q.v.) now set itself to oppose his will and Pompey, desirous of redeeming the promises made his veterans of allotments of land in Italy, joined with Gaius Julius Caesar (q.v.) and Licinius Crassus (q.v.) to form the first Triumvirate which for a time was absolute in Rome (60 B.C.) Caesar was a leader of the popular party and he aimed at becoming the sole power in the state. Crassus died in 53, and in 49 war broke out between Caesar and Pompey. The former had under his command a splendid army trained by years of campaigning in Gaul and Britain and in the battle of Pharsalia (48) Caesar was victorious. Pompey fled to Egypt and there perished and the remnants of his party were wiped out at Thapsus in 46 and Munda in the following year. Caesar was now undisputed master of the empire, but fell, after a short rule, beneath the daggers of Brutus and his associates, and his death was followed by the renewal of civil war. Gaius Octavius, Caesar's nephew and adopted son, and Marcus Antonius, Caesar's lieutenant, both aspired to be his successor, but joined in 43 with Aurelius Lepidus in a second Triumvirate to overthrow the party of Brutus and Cassius. This was accomplished at Philippi in 42, and Octavius and Marcus Antonius, setting aside the weak Lepidus, divided between them the Roman world. But while Octavius governed his western realm with energy, Marcus Antonius gave himself up to the pleasures of Cleopatra's court. War broke out between the two and in the naval battle of Actium (31) the forces of Marcus Antonius were utterly routed. Antonius fell by his own hand and Octavius was left without a rival. With Actium begins the Roman Empire.

Octavius made no change in the established forms of government. In 27 B.C. the senate conferred on him for life the government of all those provinces whose defense called for the employment of the military forces of the empire, together with the supreme command of the army and the title of Augustus. Successively Augustus united in himself the great offices of the state, the consulate, the tribunate, the headship of the sacred colleges. The senate was left with the splendid shadow of power, in reality the mere instrument of the emperor's will. The empire, and especially the provinces, found peace after a half century of civil strife and acquiesced in the rule of an autocrat whose sway was far more kindly than the selfish rule of an aristocratic oligarchy. Under Augustus the economic development of the empire made rapid progress; its parts were brought more closely together by increased means of communication; with peace came also rapid intellectual growth, and Latin literature had its golden age in the reign of Augustus. The boundaries of the empire were extended to the north by the campaigns of the emperor's stepsons Tiberius and Drusus, who carried their victorious arms to the Danube and beyond the Rhine. The last years of Augustus' reign were darkened by domestic unhappiness and the great disaster of the Teutoburg Forest where Varro's legions were annihilated by the Cheruscan chief Arminius. Augustus was succeeded in the principate by his stepson Tiberius (14-37 A.D.) who ruled

ably in the beginning but hardened with time into a gloomy despot whose suspicions fell heavily on all those members of the nobility who might in any way become rivals for power. Living in retirement on the island of Capræ he left the government to powerful ministers, of whom Sejanus (q.v.) is the most celebrated. Caius Caligula (37-41), a madman and a tyrant, was murdered by his guards and was followed by Claudius (41-54), a good-natured dotard, who was completely under the control of his infamous wives, Messalina and, after her, Agrippina. By the latter he was poisoned and Agrippina's son, Nero (54-68), succeeded to the throne. After giving the fairest promise for some years, the young emperor, in spite of such advisers as Seneca and Burrus, entered upon a course of infamous excesses and mad escapades which disgusted alike the senate and the army and brought about a revolt before which Nero fled. Unable to escape, he killed himself, the last of the Julian house of emperors.

Galba, Otho and Vitellius, military rulers all proclaimed by their respective armies, fell within the space of two years and were succeeded by Flavius Vespasianus (69-79), commander of the legions in the east. Vespasian introduced economy into the government, brought to an end the Jewish War by the storming of Jerusalem (70) and began the conquest of Britain. The brief reign of his son Titus (79-81) was marked by the eruption of Vesuvius which overwhelmed the cities of Herculaneum and Pompeii (24 Aug. 79). The reign of Domitian (81-96), a younger brother of Titus, was a period of oppression and intellectual stagnation. Cruel, despotic, half-mad Domitian resembled the last rulers of the Julian house rather than the great emperors whom he succeeded and by whom he was followed. Nerva (96-98) was succeeded by M. Ulpus Trajanus (98-117), under whom the empire attained its greatest extent. His campaigns north of the Danube resulted in the erection of the province of Dacia; Armenia and Mesopotamia were acquired and the Parthians were driven back from the Euphrates. Hadrian (117-138) had none of the warlike instincts of his predecessor, but he devoted himself to the task of organizing the affairs of the empire, and better to acquaint himself with the condition of the various provinces he made long and repeated journeys embracing every part of the Roman dominions. Hadrian was succeeded by the philosopher-emperors Antonius Pius (138-161) and Marcus Aurelius Antoninus (161-180), in whom were exhibited the highest and fullest development of the pagan character, and though the reign of the latter was disturbed by wars against the Parthians and the peoples of the Danube, it was of this age of the Antonines that an eminent historian speaks as the happiest era in the entire course of European history, if the welfare of the great mass of the population be considered.

With the death of Marcus Aurelius the decline of the empire begins. On the north the Germanic peoples were threatening the Roman frontier and on the east the new Persian kingdom arose as a formidable adversary. Commodus (180-192) neglected the affairs of the empire to win the laurels of a gladiator and was murdered by some of his followers. The Præ-

torian guard now appears as the maker of emperors. It deposed Pertinax, who had been chosen by the senate and sold the throne at auction to the Senator Didius Julianus. The armies of the provinces arose and three claimants for the throne appeared. The successful candidate Septimius Severus (193-211), successful by force of arms, ruled well and sought to repress the power of the Prætorians. The reign of his son Caracalla (211-217), one of the most vicious tyrants in Roman imperial history, is noteworthy for the extension of the rights of Roman citizenship to all free inhabitants of the empire. Caracalla was assassinated by the Prætorian prefect Macrinus, who was speedily succeeded by Heliogabohus (218-222), a priest of the sun of Emesa. Heliogabohus brought with him to Rome the orgiastic rites of the Orient and became the object of national hatred and contempt. He fell at the hands of the Prætorians, who chose as his successor Alexander Severus (222-235) who ruled with fair ability but perished in a mutiny of the German legions. There followed a period of confusion in which the decline of the empire was rapidly accelerated. Maximinus (235-238), a Thracian by birth and a soldier of fortune, crushed his rivals, the two Gordiani, but fell in battle against the forces of the senate. Balbinus and Maximus, chosen by the senate, were slain by the Prætorians, and Gordianus III ruled from 238 to 244. He was followed by Philip the Arab (244-249), Decius (249-251), Gallus (251-254), Valerianus (254-260) and his colleague Gallienus (254-268). Valerian was defeated by the Persians and taken prisoner and on the ensuing anarchy usurpers arose in every province, known collectively as the Thirty Tyrants. The border lands of the empire suffered from the invasions of the Germanic peoples and the Persians, and a pestilence which raged for 15 years (251-265) carried off one-half of the inhabitants of the empire. The fortunes of Rome rose somewhat under the following emperors: Claudius (268-270), Aurelian (270-275) who drove the Goths beyond the Danube and overthrew the Palmyran kingdom of Zenobia, Tacitus (275-276), and Probus (276-282) who held the Rhine against the Germanic tribes. Carus (282-283) perished in a campaign against the Persians and was succeeded by Numerianus (283-284) who died in the following year. The army thereupon proclaimed as emperor Valerius Diocletianus, who after the death of Carinus (283-285) became sole master of the empire.

Diocletian abandoned the ancient forms of government and transformed the empire into an absolute monarchy. He separated the civil and military administrations, created a new order of officials and brought the finances into order. The supreme power he vested in the hands of two Augusti assisted by two Cæsars who in turn were to succeed to the office of Augustus. Thus a more efficient administration would be ensured by the practical division of the empire into four parts. Diocletian, however, did not count on personal ambitions which were destined to wreck his plan. In 305 Diocletian resigned his office and compelled his fellow Augustus, Maximianus, to do likewise. They were succeeded by the Cæsars, Constantius Chlorus and Galerius, while new Cæsars were created. Con-

fusion and civil war followed and at one time there were six Augusti in the field. The struggle finally narrowed down to a contest between Licinius and Constantine, a son of Constantius, and after two wars Licinius was overthrown and Constantine became sole ruler of the empire. Constantine the Great (324-337) continued the administrative policy of Diocletian. He built Constantinople as a new capital for the empire and made Christianity the state religion. Of his three sons to whom he left power, Constantinus, Constantius and Constans, the first died in 340 and the last in 350. Constantius ruled with undisputed power from 353 to his death in 361. He was followed by Julian, known as the Apostate (361-363), who fell against the Persians and Jovian (363-364). Valentinian I ruled from 364 to 375. He left the government of the East to his brother Valens and made his son Gratian coemperor. Gratian ruled till 383 with Valentinian II as coemperor. The Goths had now broken into the empire and in 378 they inflicted a terrible defeat upon Valens at Adrianople. In this extreme Gratian conferred the government of the east upon Theodosius (379-395), who by war and diplomacy effected a settlement with the Goths. In 392 Valentinian II died and Theodosius became sole ruler of the empire. His own death followed in 395, after he had divided the empire between his sons, Honorius, to whom was assigned the West under the guardianship of Stilicho and Arcadius, who became emperor of the East with Rufinus as his adviser. The influx of Germanic tribes into Italy increased in volume. The tide of invasion was checked for a moment by the generalship of Stilicho (q.v.), but in 410 Rome was sacked by the Goths under Alaric, who, passing into southern Gaul, established a kingdom there. Other Germanic hordes wrested Spain from the Roman arms. Honorius died in 423 and was succeeded after a brief interval by Valentinian III who ruled till 455. The defeat of the Huns under Attila on the Catalaunian Fields in Gaul (451) by Aetius was the last effective assertion of the Roman power. Valentinian III was murdered in 455 and in the strife for the throne that followed, Valentinian's widow summoned to her aid the Vandals from Africa, who plundered the city of its treasures. For 20 years there came a succession of shadow kings, made and unmade by the all powerful commanders of the German mercenaries, Ricimer, and after him Orestes, who in 475 placed his young son Romulus on the throne. The troops under Odoacer (q.v.) revolted, Orestes was overthrown, the child emperor was retired to private life and in 476 Odoacer assumed for himself the title of king of Italy, thus marking the end of the Roman Empire in the West. For the history of the East Roman Empire see **BYZANTINE EMPIRE**.

History of the City of Rome subsequent to 476 A.D.—After the overthrow of the Western Empire and the defeat and surrender of Odoacer, Rome came under the rule of the Ostrogoths. The city suffered severely in the wars between the Goths and Byzantines, in the course of which it was taken six times. The depredations of the Byzantine emperors as well as of the Christian authorities, who made use of the materials and ornaments of the ancient edifices in the erection of their churches, were the cause of the destruction of

many ornaments of the imperial city; but more destructive still were the feuds that afterward (especially in the 10th century and later) raged in Rome between the leading families. In 1084 a part of the Campus Martius and most of the city in the south were devastated by the army of Normans, Greeks and Saracens which Robert Guiscard led to the relief of Gregory VII, then besieged by Henry IV of Germany in the Castle of Sant' Angelo. In the 14th century the work of destruction and depopulation was hastened by the struggles which resulted from the attempt of Rienzi (q.v.) to found a republic, and was continued during the period of confusion that ensued after the commencement of the great schism in 1378. A terrible pestilence which raged in the city in 1348 is said to have reduced the number of inhabitants to less than 20,000. A temporary check was given to the confusion that prevailed in Rome toward the end of the 14th century by Boniface IX, but order was not permanently re-established till Martin V took up his residence in the city after the schism had been virtually terminated by the Council of Constance. Martin's successor, Eugenius IV (1431-47), is usually named as the Pope under whom the work of restoration in Rome began. In this he was followed by Nicholas V (1447-55), who began the building of the Vatican, Pius II (Æneas Sylvius, 1458-64), Paul II (1464-71), who, however, quarried in the Colosseum for the erection of the Palazzo di Venezia, as did also Paul III (1534-50), when building the Palazzo Farnese. But the most important period in the architectural history of Modern Rome was the end of the 15th and beginning of the 16th centuries, when the labors of Bramante, the two Sangalli, Peruzzi and Michelangelo were pursued under the patronage of Sixtus IV, Alexander VI, Julius II and Leo X, and when the works of the great architects were adorned in the interior by artists as great or greater, such as Raphael and Michelangelo himself. In 1527 the city was sacked by an imperial army under the Constable of Bourbon. From this date onward the city began to extend more and more over all parts of the Campus Martius. Much was done in the 16th century, especially by Paul III, Pius IV, Gregory XIII and Sixtus V, for the embellishment and enlargement of the town, the improvement of the streets and the restoration of the fortifications. Many remains of antiquity were then rescued from destruction, although many more were sacrificed, particularly under Sixtus, for the sake of modern structures. In the 18th century Benedict XIV, Clement XIV (founder of the Museo Pio-Clementino) and Pius VI deserve special mention for their efforts to preserve and beautify Rome. In 1798 Rome was occupied by the French and deprived of many of its art treasures. At the same time a republic was erected in Rome, but this only lasted for a short time, and after a series of disturbances and changes the Pope was again reinstated in his dominions in 1799. (See **ITALY**). From 1809 to 1814 Rome was once more under French rule, the States of the Church having in the former year been annexed to the Napoleonic Empire. The short-lived Roman republic of 1848-49 was followed by the restoration of the papal rule in 1850. On 20 Sept. 1870 the Italian troops, after effecting a breach in the Porta Pia, in the north-

east of the city, marched in along the Via di Porta Pia (henceforth called Via Venti Settembre). Since then Rome has been in the possession of Italy, and since the 1st of July of the following year the capital of the kingdom.

JOHN S. PATTON,
Librarian, University of Virginia.

ROME, N. Y., city in Oneida County, on the Mohawk River and at the junction of the Barge, Erie and Black River canals, and on the New York Central and New York, Ontario and Western railroads. The city is about 110 miles west by north of Albany and 15 miles northwest of Utica. It is at the head of the Mohawk Valley, on a plateau about 450 feet above sea-level. The first settlement was made in 1760 by John Roof. The central part of the city is the site of Fort Stanwix, erected here in 1758 at a cost of over \$200,000. It was then a place of great importance as it was the defensive point in the "carrying place," or portage, that part of the route between the Atlantic and the Great Lakes, where the journey had to be made by land. Fort Stanwix was a storm centre in the French War and also in the Revolutionary War. At Rome the Stars and Stripes were first unfurled in battle; for here in July and August, 1777, there were many sharp engagements, and finally the Tryon County Militia under Herkimer defeated the British under St. Leger in the battle at Oriskany. A government arsenal was established here in 1814, but in 1873 was sold for a factory. In 1819 Rome became a village and in 1870 was chartered as a city.

The greater part of the water supply is taken from Fish Creek, about 13 miles from the city. The surrounding country is devoted to farming and dairying; but Rome is a manufacturing city. The chief industrial establishments are brass and copper mills, locomotive works, knitting mills, brick yards, canneries, metal bedstead factories, wire works, automobile and radiator factories, and creameries. The facilities for transportation give Rome considerable commercial advantages. The prominent public buildings are the Rome State Custodial Asylum for incurable insane, the Oneida County Home, the municipal buildings and some of the business blocks. There are several churches and missions. The educational institutions are the Central New York Institution for Deaf-Mutes, Academy of the Holy Names (Roman Catholic), opened in 1865, several graded public and parish schools, public kindergartens, private schools and libraries. The libraries are the high school, the Jervis Public and the Y. M. C. A. There are national banks with a combined capital of over \$200,000 and savings banks. The city debt is \$915,614.55, largely due to the amounts paid for city sewerage, waterworks and new schools. The assessed valuation is about \$10,955,875 yearly. The government is vested in a mayor and a council of 15 members, who hold office three years. Pop. 23,868.

ROME, Œcumenical Councils of, are six in number, namely, five Lateran Councils, so called as having been held in the Lateran Palace, and the Vatican Council, held in the palace of the Vatican. 1. The ninth general Council of the Church, the first Lateran Council, was held in the reign of Calixtus II in 1123; it confirmed the concordat of Worms regarding Investiture (q.v.). 2. The second Lateran (10th general) Council, held in 1139 under Innocent II, condemned the Manichæan errors of Arnold of Brescia (q.v.). 3. The third Lateran (11th general) Council, under Alexander III in 1179, condemned the heresies

and impieties of the Waldenses and Albigenses. 4. The 12th general Council (4th Lateran) held in 1215 in the pontificate of Innocent III, confirmed the doctrine of transubstantiation and promulgated decrees for the reformation of abuses in the Church and the extirpation of heresies. 5. The 19th general Council (5th Lateran) under Julius II, assembled in 1511, was in session till 1517 when Leo X was Pope; it enacted some laws for the reformation of clerical discipline and procured from the king of France, Francis I, the revocation of the Pragmatic Sanction (q.v.) which the French clergy had ever regarded as the bulwark of the Gallican Liberties. 6. The Council of the Vatican (20th Œcumenical council), which was opened 8 Dec. 1869 and closed 20 Oct. 1870, under Pius IX, affirmed as the teaching of the Catholic Church the doctrine that the Pope when teaching *ex cathedra* and defining matters of faith or morals is always divinely aided and is infallible.

ROME STATE CUSTODIAL ASYLUM, an institution for the custody, maintenance and treatment of the custodial class of feeble-minded, located at Rome, N. Y. It was formerly the Oneida County Insane Asylum and Almshouse, but by the acts of the legislature in 1893 and 1894, the building and grounds were purchased by the State. Among other things, calisthenics, dancing, drilling, kindergarten, sloyd and articulation are taught. Agricultural colonies for the brighter male inmates have also been established. Feeble-minded are committed to this asylum from all counties in the State, according to the quota assigned each county, which is based on the population of the respective counties, as compared with the capacity of the institution. For their care there are over 20 large buildings, beside several small sheds, etc. The average number of inmates is about 750.

ROMEO AND JULIET. This, the first tragedy that Shakespeare wrote, was first printed in 1597 as "a garbled and imperfect rendering, made up partly from copies of portions of the original, partly from recollection and from notes taken during the performance." The second quarto, a revised edition, "newly corrected, augmented and amended," was published in 1599, a third quarto in 1609, and a fourth version in the first folio (1623). Although there is no evidence that the play was acted before 1596, it is probable that it was written as early as 1594, although later revised. The immaturity of the play is indicated in the large number of conceits, puns and other forms of quibbling, such as we have in 'Love's Labors Lost' and 'Mid-Summer Night's Dream'; in the preponderance of rhymed verse and in the decidedly lyrical character of many of the passages. On the other hand the excellence of the plot, the supreme beauty of the best scenes, the assured mastery of blank verse displayed in parts, indicate an excellence not found in the earlier plays and suggest, therefore, careful revision of an earlier version. The story had long been a popular one in Italy and France when it was translated in a long narrative poem entitled 'The Tragical History of Romeo and Juliet' by Arthur Brooke (1562) and in a shorter prose version by William Painter in his 'Palace of Pleasure' (1567).

There is no better evidence that Shakespeare conceived his task in handling sources as one of adapting and not originating plots than a detailed comparison of Brooke's poem and the play. Not only are the chief characters and practically all the minor ones found in the poem, but entire scenes and many bits of psychological insight attributed to Shakespeare. The change of time from four or five months to as many days, the dramatic contrasts of characters and scenes and the heightened poetical language—all indicate Shakespeare's power of dramatization. What stirred the interest of Shakespeare in reading the old story was the dramatic situation presented by the lovers in conflict with their environment. Tragedy has not become with him, as in his later plays, so much the inner conflict between the complex elements of a hero's soul. Romeo and Juliet are a pair of "star-crossed lovers" who move somewhat inevitably toward their fate. Theirs is a love that knows no impediment; they bear it out even to the edge of doom. It is the great and typical love tragedy of English literature. The love that unites Romeo and Juliet springs from no worldly consideration; it is natural, spontaneous, all-absorbing. There is no moral error involved in their tragedy—at the best a tragic error. One of the best effects of the play is found in the contrast between these highly emotional lovers and Paris and Lady Capulet, to whom love is a mere conventional relationship; the Nurse, to whom it is a matter of pleasurable instinct and even vulgar comment; Friar Laurence, with his somewhat worldly counsels against the excess of it; and Mercutio, transfixing it with the shafts of his reckless and cynical wit. In the blending of comedy and tragedy, which is more marked in this tragedy than in any of his others except perhaps 'Hamlet,' Shakespeare was following the demand of life in its more complex aspects rather than the laws of classic art. While the defects of the play already suggested tend to mar the complete unity, the final impression is that of the great scenes: The Balcony Scene with the beauty of the Italian sky at night and the softest music of lovers' tongues; the Dawn Scene, when the earth is a-quiver between night and day and the lovers breathe out in each other's arms the saddest of farewells; and the Grave Scene, where the old Friar unites above the graves of the lovers the two families from whose loins they sprang. Then we know that we are reading the greatest of love poems, if not the greatest of Shakespeare's tragedies.

EDWIN MIMS.

RÖMER, ré'mër, Ole, Danish astronomer: b. Aarhus, 25 Sept. 1644; d. Copenhagen, 19 Sept. 1710. After study at the University of Copenhagen he was in 1671-81 at Paris, where he made observations in the royal observatory and was elected to the Academy. In 1681 he was made professor of mathematics and director of the observatory at Copenhagen, and subsequently became a counselor of state. He is known chiefly as the discoverer of the velocity of light, which he determined by observation of the eclipses of the satellites of Jupiter. He found that when Jupiter and the earth were on opposite sides of the sun, the eclipse seemed to occur too late; when on the same side, too early. The extreme deviation from mean time

he computed at 11 minutes; it is now known to be approximately 8 minutes 20 seconds, that is, light crosses the space between the earth and the sun (a little less than 93,000,000 miles) in about 8 minutes. (See **LIGHT**). Römer invented the transit instrument (1689) and meridian circle (transit and vertical circle combined; 1690). Consult Grant, 'History of Physical Astronomy' (1852); Horrebow, Peter, 'Adversaria' (1910).

ROMERO, rō-mā'rō, Don Matias, Mexican diplomat: b. Oaxaca, Mexico, 24 Feb. 1837; d. Washington, D. C., 30 Feb. 1898. He was graduated at the Academy of Theoretical and Practical Law, Mexico City, in 1855, and admitted to the bar in 1857. In the revolution of that year he supported the government and served as secretary to Melchor Ocampo. In 1859 he was appointed secretary to the Mexican legation at Washington and in 1860-63 was *chargé d'affaires*. He then returned to Mexico where he was commissioned colonel in the army, became chief of staff to General Diaz and later in the same year resumed his diplomatic career as Minister to the United States. He held the portfolio of the treasurer in Juarez's cabinet in 1868-73, was a member of the Senate in 1876 and on the election of Diaz to the Presidency he resumed his position in the treasury. He was Postmaster-General in 1879-80 and in 1882 he was again sent as Minister to the United States, where he arranged the boundary question and concluded a reciprocity treaty. He was reappointed in 1884 and continued in the position until his death. He published more than 50 volumes, chiefly of technical reports, among which are 'Coffee-culture on the Southern Coast of Chiapas' (1875); 'Correspondence of the Mexican Legation at Washington during the French Intervention' (1870-85); 'The State of Oaxaca'; 'Mexico and the United States.'

ROMEYN, rō'min, John Brodhead, American Presbyterian clergyman: b. Marbletown, N. Y., 8 Nov. 1777; d. New York, 22 Feb. 1825. He was graduated at Columbia in 1795 and was licensed to preach in 1798. He held charges at Rhinebeck, Schenectady, Albany and New York successively, attained a high reputation as a theologian and was popular as a preacher. He was one of the founders of Princeton Theological Seminary, president of Transylvania University, a trustee of Princeton College and a moderator in the Presbyterian General Assembly. His sermons were collected and published in 1816.

ROMILLY, rōm'ī-lī, Sir Samuel, English statesman and jurist: b. 1 March 1757; d. London, 2 Nov. 1818. He entered Gray's Inn to study for the bar, to which he was called in 1783, and gradually rose to distinction in the Court of Chancery, in which he ultimately took the lead. During the short administration of Fox and Lord Grenville (1806) he was appointed solicitor-general (being member for Queensborough), and knighted. When the Whigs went out of office he remained in Parliament, where he pleaded the necessity of a revision of the criminal code, with a view to the limitation of capital punishment, and a more appropriate regulation of the scale of penalties. To his exertions may be traced the final de-

termination of the executive to the reform and condensation of the various acts in regard to crime, effected under the superintendence of Sir Robert Peel. After a lifetime spent in securing mitigation of the criminal laws, he died by his own hand. Consult 'Memoirs,' written by himself (1840); also 'The Creevy Papers' (1904).

ROMNEY, rōm'nī, *George*, English painter: b. Beckside, near Dalton-in-Furness, Lancashire, 15 Dec. 1734; d. Kendal, 15 Nov. 1802. His father was a cabinet-maker, and the boy learned this trade, but he also taught himself drawing and wood-carving and at 19 was apprenticed to a portrait painter at Kendal named Steele. In 1757 he entered a career as portrait painter, and after local success went to London (1762), leaving his wife (whom he married in 1756) and his two children in Kendal. The following year he won a prize offered by the Society of Art for a historical painting, by his 'Death of General Wolfe,' and rose steadily in popularity until he held a position beside Reynolds and Gainsborough as a portrait painter. He visited France twice; once in 1764 and again in 1790, and resided in Italy during the years 1773-75. While in Italy he gave much attention to the works of Correggio, and this, along with his study of the nude, greatly influenced his after-work. In 1783 Romney made the acquaintance of Emma Hart, who afterward married Sir William Hamilton, and she became the model from which he painted such well-known pictures as 'Saint Cecilia,' 'Joan of Arc,' 'A Magdalen,' 'A Bacchante' and 'Sensibility.' His 'Lady Hamilton as Circe' sold in 1890 for \$20,210; his 'Lady Hamilton as Sensibility' in the same year for \$15,025. In the Metropolitan Museum in New York are his 'Lady Hamilton as Daphne,' 'Mrs. Fitzherbert' and 'Mrs. Scott-Jackson.' Gradually he began to withdraw from portrait painting and gave more time to historical and imaginative work. In 1786 Alderman Boydell founded his famous Shakespeare gallery, to which Romney contributed a scene from the 'Tempest' and the 'Infant Shakespeare attended by the Passions'; while about this time he painted 'Milton and his Daughters' and 'Newton making Experiments with the Prism.' In order to find room for these great imaginative pictures he erected a large studio at Hampstead, which he occupied in 1797. But his health at this time began to fail, and in the summer of 1799 he returned to Kendal utterly weakened in body and mind. He had only seen his wife twice since he left her 35 years before, yet she received and nursed him faithfully through his premature senility and dotage until his death.

The art of Romney displays a certain fitfulness of achievement due partly to the instability of his character, and partly to his defective early training. His defects of technique are most apparent in his historical and imaginative subjects; it is only when we examine his portraits, and especially his female portraits, that we find that beauty of form and subtle charm of color which place him among the greatest portrait painters of the 18th century. Consult Hagley, 'Life of George Romney' (1809); Gamlin, 'George Romney and His Art'; Gower, 'Romney and Sir Thomas Laurence'; J. Rom-

ney, 'Memoirs of the Life and Writings of George Romney' (1830).

ROMNEY, W. Va., city and county-seat of Hampshire County, situated in the valley of the South Branch of the Potomac River and on the Baltimore and Ohio Railroad, about 100 miles west of Washington, D. C. The city's industries include a barrel factory, planing mill and a flouring mill. There are two banks—one State and one National. The value of the city's taxable property is \$899,342. The annual receipts average about \$5,850. The chief public buildings are the county courthouse, Literary Hall, the State institution for the deaf and blind and the high school. There is also a school for negroes. The city is well laid out with wide streets running at right angles, good water-supply system, electric lights and sewage system. It is the shipping centre for a fruit-growing section. The form of government is that of the ordinary municipal corporation chartered by the State. Pop. about 1,300.

ROMNEY (W. Va.), *Engagements at*. This place was important as an outpost of the Union troops guarding the Baltimore and Ohio Railroad and also as a base for operations up the valley of the south branch of the Potomac. It was held early in June 1861 by Col. Angus McDonald, with about 500 Virginia troops and two guns. On the night of 12 June Col. Lew Wallace, with 800 men of the 11th Indiana regiment, went by rail from Cumberland to New Creek Station and marching across the mountains attacked and routed McDonald on the 13th, and on the same day started on his return by the route he had come. Information of Wallace's movement reached Gen. J. E. Johnston, commanding the Confederate forces at Harper's Ferry, on the morning of the 14th, and supposing it to be the advance of General McClellan's column from West Virginia to co-operate with General Patterson, who was threatening to cross the Potomac at Williamsport, Johnston ordered Col. A. P. Hill, with three regiments, to march on Romney and check the movement (see *NEW CREEK*). He burned all the bridges on the Potomac from Harper's Ferry to Williamsport, abandoned Harper's Ferry, and fell back to Winchester. On 23 September Lieutenant-Colonel Cantwell, with detachments of the 4th and 8th Ohio, a company of cavalry and one gun, marched from New Creek, drove McDonald's forces from Romney on the 24th and with a loss of three killed and 30 wounded, returned to New Creek, closely followed by McDonald's cavalry. On 25 October Gen. B. F. Kelley, with detachments of Ohio and West Virginia troops and two companies of cavalry, in all about 2,500 men and two guns, started from New Creek for the permanent occupation of Romney. He captured it on the 26th, after a sharp engagement with McDonald's forces, driving them beyond the town on the Winchester road, and capturing all their trains, two guns, 300 stands of arms and much camp equipage. A supporting column of the 2d Maryland, Colonel Johns, marching from the mouth of Patterson's Creek, through Frankfort and Springfield, was met by the 114th Virginia militia, under Col. A. Monroe, at the bridge over the South Branch, seven miles from Romney, checked, and fell back to Patterson's Creek, with a loss of six or eight in killed and wounded. On 28

October Gen. "Stonewall" Jackson was assigned to the command of the Valley District, with headquarters at Winchester, and immediately prepared to clear the valley of Union troops. He called out the militia, and being reinforced by General Loring's division from West Virginia, set out late in December to destroy the Chesapeake and Ohio Canal and the Baltimore and Ohio Railroad, and to recover Romney. To withdraw his attention from the railroad, Colonel Dunning, in command at Romney, made a demonstration toward Winchester with 2,000 infantry and cavalry and six guns. He marched on the night of 6 Jan. 1862, and next morning at Blue's Gap, 16 miles from Romney, fell upon 700 Virginia militia, under Colonel Monroe, scattered them and captured two guns, several prisoners and some baggage, without the loss of a man, and returned to Romney. On the same day Jackson left the vicinity of Hancock and marched for Romney. Hearing of his approach, the Union troops retreated from Romney on the 10th toward New Creek. Jackson occupied the town on the 14th and placed Loring's division there in winter quarters. Loring and his officers complained to the Richmond authorities, and the Confederate Secretary of War ordered Jackson to move the division back to Winchester, which was done 31 January, and on 7 February the town was again occupied by Union troops under Gen. F. W. Lander. Between this time and the close of the war the town changed hands several times, but, for the greater part of the time was in Union possession. Consult 'Official Records' (Vols. II and V).

ROMOLA, George Eliot's sole experiment in historical fiction, was originally published as a serial in *The Cornhill Magazine* from July 1862 to August 1863. Hitherto George Eliot had taken the substance of her novels from memories of English life in the midland counties where she had grown up and passed her youth. Into her new field she was led primarily by an interest in Savonarola, the great Florentine preacher and reformer of the Renaissance. Twice she visited Florence, where she made exhaustive studies in the politics of the period in order that her details might have the exactness of an historian. Her novel opens with the death of Lorenzo, the Magnificent, in 1492, and closes with the execution of Savonarola in 1498. The portrait of Savonarola, with which she took great pains, has been subjected to much criticism. As she paints the prophet and preacher, he has a sort of dual personality. In her words: "The passionate sensibility which, impatient of definite thought, floods every idea with emotion and tends toward contemplative ecstasy, alternated in him with a keen perception of outward facts and a vigorous practical judgment of men and things." So without his being quite aware of it, Savonarola comes perilously near duplicity in his dealings with the people. He invokes the "trial by fire," but hesitates and fears when the day of the ordeal arrives; he watches the clouds, and delays until the rains come to quench the fires prepared for him; then he can say that the hand of God is visible in the heavens to protect him. Still, in the end George Eliot says: "Power rose against him not because of his sins, but because of his greatness — not because he sought

to deceive the world, but because he sought to make it noble."

On this historical background is projected the story of Tito Melema, a young Greek, beautiful and clever, who in a few short years betrays all who put their trust in him — Romola, Tessa, Savonarola and Badassarre his foster-father, at whose hands he finally meets his fate. By many Tito is regarded as George Eliot's finest character study; but with this opinion I do not agree. No one can deny the relentless logic with which George Eliot pursues the downward career of this pleasure-loving young man; but the study would be more impressive were not Tito so weak when the reader first meets him. We can understand his ingratitude toward Baldassarre and that Tessa should be deceived by him; but we cannot understand the ease with which he imposes upon Romola and Savonarola. The plot, too, develops into a loose revenge-tragedy of the Elizabethan type, wherein Baldassarre, an impossible character outside of fiction, appears and disappears whenever the occasion demands his presence or his absence. Great as is the novel, it will not stand comparison with those novels in which George Eliot depicts the life she knew. Romola is really a new and weaker version of Maggie Tulliver in 'The Mill on the Floss,' without the flesh and blood of the Margaret in Charles Reade's 'Cloister and the Hearth,' who was Romola's contemporary; and for George Eliot's most powerful study in the deterioration of character, we must turn from Tito Melema to Dr. Lydgate in 'Middlemarch,' who began his career with noble ideals and afterwards lost them.

WILBUR L. CROSS.

ROMULUS, rōm'ū-lūs, mythical founder and first king of Rome. He is said to have been the son of Sylvia, generally, but incorrectly called Rhea Silvia, daughter of Numitor, king of Alba, and one of the priestesses of Vesta. By the god Mars she became the mother of male twins, whom Amulius, who had usurped the throne of Numitor, ordered to be thrown into the Anio, but the basket containing the two boys, Romulus and Remus, was stranded at the foot of the Palatine Hill. Here a she-wolf, going down to the river to drink, was attracted by their cries, carried them to her cave, and suckled them. Some time afterward chance brought thither Faustus, the king's herdsman, who took them home and educated them. With him Romulus and Remus spent their youth. When they had grown up Amulius was deprived of his usurped throne by Romulus who reinstated his grandfather Numitor in his dominions. After this the brothers resolved to build a city. Romulus wished to place it on the Palatine, Remus on the Aventine, or on another hill three or four miles down the Tiber. Determining to reach a decision by consulting the augurs, each took his station on his favorite hill; the night passed away, and at the first streak of dawn Remus saw six vultures; but at sunrise, when this news was brought to Romulus, 12 vultures flew by him. Each claimed the augury in his favor; but as their companions decided for Romulus his brother was forced to yield. Romulus, to outline the boundary of the city, yoked a bullock and a heifer to a plow, marked a deep

furrow around the base of the Palatine, and guided by this line began to raise the wall. Remus leaped over the rude rampart in scorn, whereupon the enraged Romulus slew him. According to another tradition Remus fled from the anger of his brother beyond the Alps, and founded Rheims. Romulus was immediately struck with remorse, and could obtain no rest till he appeased his brother's shade by instituting the festival of the Lemuria for the souls of the departed. Thus is Rome said to have been founded in the year 753 (or according to others 752 or 751) B.C. The small number of friends who had followed Romulus were insufficient to people his city. Men enough were gained by making the city a refuge for exiles; but the Roman citizens soon wanted women. Romulus thereupon instituted a religious festival, to which he invited the Sabines with their wives and daughters. In the midst of the festival the unarmed strangers were suddenly attacked, and the Sabine women borne away as captives. The two states thus became engaged in war; but the entreaties of the ravished females, who threw themselves between the contending parties, at length effected a peace, and Rome gained by her union with the Sabines an important addition. According to tradition Romulus ascended to heaven into the company of the gods, after he had completed the work of founding the eternal city; and, until the introduction of Christianity, Rome worshipped its founder in temples expressly dedicated to him.

RONALDSHAY, rŏn'ald-shā, North and South, two of the Orkney Islands (q.v.), Scotland.

RONAYNE, rŏ-nān', Maurice, American Roman Catholic clergyman and author: b. Castlemartyr, Ireland, 3 April 1828; d. Fordham, N. Y., 3 March 1903. He received his education for the priesthood in Ireland and France, and entered the Jesuit Order in 1853. He came to the United States in 1855, was ordained to the priesthood in 1856, taught in Saint John's College, Fordham, N. Y., and was for many years professor of history in the college of Saint Francis Xavier, New York. In 1898 he returned to the college at Fordham, where he spent the remaining years of his life as spiritual director. His writings upon the labor question may be found in various Roman Catholic periodicals. His most important books are 'Religion and Science' (1879), and 'God Knowable and Known.'

RONCADOR, one of several Californian drum-fishes of the family *Sciaenidae*, especially the red *Sciaena saturna*, and *Roncador stearnsi*, both food-fishes of some importance.

RONCESVALLES, rŏn-thēs-vāl'yēs (Fr. RONCEVAUX, rŏns-vō), Spain a valley in Navarre, between Pamplona and Saint Jean de Port, where, according to tradition, the rear of Charlemagne's army was defeated by the Arabs in 778, and the brave Roland killed. The battle forms an essential part in the fabulous cycilus of Charles the Great or Charlemagne. (See **ROLAND** and **ROMANCE**). Roncesvalles, the chief place of the valley, 25 miles northeast of Pamplona, is traversed by the so-called Gates of Roland, leading over the Pyrenees to France; in the church fabulous antiquities bearing the

name of Roland are shown. The French under Moncey defeated the Spaniards here in 1794, and here Soult took up a strong position in 1813, from which he was dislodged by Wellington.

RONCO, a West Indian name for various drumfish of the genus *Hæmulon*, popular among fishermen and in the market, especially *H. bonariense* (ronco prieto) and *H. parra* (ronco blanco) or salior's choice.

RONDEAU, rŏn'dō, or **RONDO**, originally a short lyric of 13 lines divided into three unequal strophes; the two or three first words form the burden, and are repeated after the 8th and 13th line. The term is now chiefly applied to a musical composition, vocal or instrumental, generally consisting of three strains, the first of which closes in the original key, while each of the others is so constructed in point of modulation as to reconduct the ear in an easy and natural manner to the first strain. The rondeau takes its name from the circumstance of the melody going round after both the second and third strain to the first strain, with which it is finally closed. While it frequently forms the last movement of a sonata or a symphony, it is quite as common as a separate composition.

RONGE, Johannes, yŏ-hān'nēs rŏng'ē, German Anti-Catholic religious leader: b. Bischofswalde, Silesia, 16 Oct. 1813; d. Vienna, 26 Oct. 1887. He studied theology at the University of Breslau 1837-39, was ordained to the priesthood in 1840, and in 1841 became chaplain at Grottkau. Having manifested an opposition to the discipline of the Church, he was suspended in 1843. On 1 Oct. 1844 he published a letter against the exhibition of the 'holy coat' at Treves, which was soon followed by the organization of the so-called German Catholic congregations. (See **GERMAN CATHOLICS**). He published in succession a number of pamphlets, in which he called on the Roman Catholic laity and the lower clergy to leave the communion of that Church. These were generally understood to be written from the standpoint of deism; and in subsequent years Ronge pronounced himself more and more unreservedly in favor of deistic doctrines. He took part with the radicals in 1848 and was obliged to flee to London, where he signed in 1851, with Ruge, Struve, Kinkel, and others, a democratic manifesto to the German people, and where he became the leader of a free congregation. In consequence of the amnesty granted by the Prussian government, he in 1861 again made his appearance in Breslau. He founded a reform association at Frankfort-on-the-Main in 1863, and from 1873 resided at Darmstadt. Consult the article 'Deutschkatholiken' in Wetzzer und Welte's 'Kirchenlexikon.'

RONSARD, Pierre de, pē-ār dē rŏn-sār, French poet: b. Chateau de la Poissonnière, Vendômois, 11 Sept. 1524; d. Saint Cosme near Tours, 27 Dec. 1585. He entered as page the service of the dauphin, and then of the Duc d'Orléans, second son of the king. In 1538 he accompanied James V of Scotland and his bride Marie de Lorraine back to their kingdom and remained at the Scottish court three years. He also spent six months at the English court and was then employed in a diplomatic capacity in

Germany, Piedmont, Flanders and Scotland. On his return to France he devoted himself with great eagerness to the study of literature. With a group of followers, self-styled the "Pleiade," he cast away the literary traditions and ideals of mediæval France and sought inspiration from the Latin and Greek classics. The result was transformatory, and Ronsard's influence on the progress of French letters was thus very great. In the Floral Games at Toulouse he triumphed over his competitors and received a silver statue of Minerva which he presented to Henry II. He was greatly esteemed by that prince and by his successors, Francis II and Charles IX; obtained the abbey of Bellocane and was also prior of Saint Cosme. His writings, consisting of sonnets, madrigals, eclogues, lyric pieces, elegies and satires and a fragment of an epic poem, 'La Franciade,' were read with almost incredible admiration by his contemporaries and brought him valuable presents from Queen Elizabeth of England and the imprisoned Queen of Scots. Many of his sonnets and odes possess considerable merit, but his style is marred by affectation and his pages are filled with freshly imported words from the classic languages. There are editions by Blanchemain (1856-67) and Marty-Laveaux (1887). Consult Perdrizet, P., 'Ronsard et la Réforme' (1902).

RÖNTGEN RAYS. See ROENTGEN, WILHELM KONRAD; X-RAY.

ROOD, Ogden Nicholas, American physicist: b. Danbury, Conn., 3 Feb. 1831; d. New York, 12 Nov. 1902. He was graduated at Princeton in 1852 and afterward studied at Yale and at the universities of Munich and Berlin. He was appointed to the chair of physics and chemistry at the University of Troy in 1858, and in 1863 accepted the chair of physics at Columbia where he remained until his death. In his researches and experimental work he showed great originality and skill, his specialties being in the fields of mechanics, optics, acoustics and electricity. His original experiments included the application of stereoscopic photography to the microscope, the quantitative analysis in color contrast, and the measurement of the duration of flashes of lightning. He was the first to describe a photometric method that is independent of color. He was a leading member of the prominent scientific societies, author of nearly 100 monographs and also wrote 'Modern Chromatics' (1881); 'The Voice and the Ear,' etc. Consult files of the *American Journal of Science*.

ROOD, a cross. The term is more particularly applied to the large cross erected in Roman Catholic churches over the entrance of the chapel or choir; this is often of a very large size, says the 'Glossary of Architecture,' and when complete is like other crucifixes, accompanied by the figures of Saint John and the Blessed Virgin, placed one on each side of the foot of the cross, but these are more often omitted. The rood-loft was the gallery in which the cross was set to view, and the rood-arch was the arch between the nave and the chancel, that is, the arch over the rood-loft. Rood-lofts became common in England in the 14th century, were ordered taken down by the government in the 15th and 16th centuries and temporarily were restored under Queen Mary. Consult 'Irish Constitution of 1635,' p. 110.

ROOD. See WEIGHTS AND MEASURES.

ROOD-SCREEN, a screen of wood, stone, or wrought iron, separating the western end of the ritual choir from the nave in many churches and forming a support for the rood, a cross or crucifix, placed in the centre of the rood-beam. Sometimes the rood-screen was double, with vaulting between and a rood-loft over it, as at Southwell Cathedral. It was frequently ornamented with niches in which were placed statues as at York Minster and Rochester Cathedral.

ROOF, the covering of a building by which the interior secures protection. In ordinary acceptance the term includes the covering and the supporting framework, though in carpentry the term is applied only to the framework. Roofs are broadly distinguished as flat or sloping. The former were used almost exclusively among ancient peoples and are at present employed largely in Eastern countries where the roof is

FIG. 1.

devoted to some extent to domestic purposes. The sloping roof, being to a great extent an ornamental consideration, has given way to the flat roof in modern business buildings, where economy of construction prevails. Flat roofs are usually covered with tar, metal, asphalt or gravel. The framework of the roof has been, until the modern application of iron to this use, almost exclusively of timber; and the end desired has been to arrange the timbers in such relations as to secure the greatest strength and stiffness consistent with the minimum of weight; also to avoid lateral strain or thrust upon the walls. The form chosen has been that of two or more inclined planes for the slopes of the roof over the enclosed space. Two inclined planes are formed by a series of sloping rafters having the lower ends tied together to

FIG. 2.

prevent spreading, the upper ends forming the angle of the roof and connected by the ridge-piece. The method of tying the rafters is by a horizontal beam laid across the span, receiving at each end the foot of one of the rafters, the two being securely mortised. This is called a tie-beam. When the roof is of wide span it becomes necessary to secure the tie-beam against settling in the middle, and this is done by joining the centre of the tie-beam and the ridge angle of the rafters by a king-post (A in Fig. 1).

Sometimes two vertical beams are suspended from the rafters to the tie-beam, and these are called queen-posts (BB in Fig. 2).

Braces or struts (c) may be carried from the foot of the suspended posts to the rafters to afford additional stiffness to the frame. Further support is given to the rafters in roofs of long span by one or a series of transverse longitudinal beams called purlins. Early Christian basilicas, of which San Miniato in Florence is typical, had roofs of the character just described. When the period of Gothic architecture was reached the king-post and tie-beam were carved and molded, in cases where wooden roofs were used instead of stone vaulting. Open timber roofs were used in England more than on the Continent for churches and halls. The finest example is that of Westminster Hall (Fig. 3) completed in 1399 and having a span of 68 feet.

FIG. 3.

In this example the central part of the tie-beam is cut away, and the great rigidity of the framework prevents any inordinate thrust upon the walls.

The inclination or pitch of the roof seems to be regulated by taste, after the general law is observed that countries of moist climate require a sloping roof to carry off the rain and snow. The slope of a Greek pediment, marking that of the roof, varied from 15 to 16½ degrees; Roman roofs, the roofs of Romanesque buildings, and also those of the Renaissance era, generally carried an inclination increased one-quarter to that of Greek buildings. The Gothic pitch sometimes reached to 50 or 60 degrees; but since the period of the prevalence of one particular style, great latitude has been observed,—Germany and the Netherlands favoring a steep roof, and France retaining a moderately steep inclination even in her Renaissance structures; but England has tended toward the lowering of the pitch.

The commonest form is the gable roof where each end terminates in a gable. Modifications of this are the curb-roof in which the slope is broken, further distinguished as the gambrel roof where only two opposite sides are sloping; the French roof where the slope beneath the curb approaches almost to verticality and that above is nearly flat or with a slightly visible slope; the Mansard roof, named after its de-

signer, Mansard, where the slope beneath the curb is pierced by dormer windows. The hipped roof is one having a double pitch and no gables, and the ridge shorter than the parallel wall plates. The pyramidal roof is one where the ridge is so short as to approach a point. Various modifications of these general forms are known by a variety of names.

The recent use of iron for roof-frames has become very general, especially where wide spans are required as in the case of railway train sheds. The general principles of construction employed in wooden frames are utilized in iron ridge roofs; but for oval or conical roofs, the iron trusses require a consideration of the principles governing those of bridge trusses. See BRIDGES.

The covering of sloping roofs is of various material, such as thin slabs of stone, thatch, tiles, slate, metal, shingles and cement. Metal shingles and asbestos shingles are increasing in use. Of the 120 factories in the United States making roofing materials, one-fourth make metal shingles and ceilings. There are employed in these factories over 4,000 people and the gross annual product is valued at about \$28,000,000. There is also a production of over \$5,000,000 worth in factories mainly devoted to other industries.

ROOFING TILES. See TILES.

ROOK, Edward Francis, American artist: b. New York, 1870. He studied under Jean Paul Laurens and Benjamin Constant in Paris. He received the Temple gold medal at the Philadelphia Academy of Fine Arts in 1898; and was awarded medals at the Buffalo, Saint Louis, Buenos Aires and Panama Expositions. Among his works are 'Deserted Street, Moonlight' (Pennsylvania Academy, Philadelphia), and 'Pearl Clouds, Moonlight' (Cincinnati Art Museum).

ROOK, a European crow (*Corvus frugilegus*), having the base of the bill, forehead and upper part of the throat naked. The rook possesses a voice much less harsh than that of the crow. Rooks are gregarious in habits, and nest in great communities or rookeries, thus differing from other species of the family. The nests, which are placed in tree tops, are built or repaired early in March, and the young are hatched in April. The food consists chiefly of grubs, although grain appears to form part of the dietary. In Great Britain the rook is a permanent resident or partial migrant, but in other parts of Europe these birds appear to be more or less strictly migratory. The same species is found in Asia, where related species having the facial feathers only partially deciduous also occur.

ROOKE, rük, Sir George, English admiral: b. 1650; d. 24 Jan. 1709. At an early age he entered the royal navy, and in 1689 commanded a squadron at the siege of Londonderry, was knighted for his burning of six French ships at Barfleur in 1692 and in 1694 became one of the lords commissioners of the Admiralty and admiral. He distinguished himself in the fight against the French and Spanish fleets in Vigo Bay (1702), and at the capture of Gibraltar in July 1704. On 9 Aug. 1704 he fell in with a French fleet of much superior force, under the Comte de Toulouse, off Malaga, and an engage-

ment which lasted nearly the whole day ensued. Victory remained with the English, though none of the French ships were captured. The news of the Malaga victory reached England during the celebration over Blenheim, and Rooke's name was put forward for honors along with Marlborough's; but being a Tory he suffered from the jealousies of the Whigs, the dominant power. His command was taken away from him and he retired in disgust to his family seat in Kent.

ROCKWOOD POTTERY. See POTTERY.

ROON, rōn, Albrecht Theodor Emil von, Prussian soldier: b. Pleushagen, 30 April 1803; d. Berlin, 23 Feb. 1879. He entered the army in 1821; was attached to the Topographical Bureau in Berlin, 1833-35; became captain in 1836, and major in 1842; in 1848 became chief of staff of the 8th Army corps at Coblenz, took part in the campaign at Baden of that year; and was promoted lieutenant-general in 1859. In the latter year he was appointed a member of a commission on the reorganization of the army. He had given special attention to this subject for many years, but his proposals which were in effect an extension with modifications of Scharnhorst's system, embracing a universal three years' service and a reserve, were carried only after long opposition. The Austrian War of 1866 demonstrated that value of his system. He attended the German emperor throughout the Franco-Prussian War, and was created a count in 1871. The Ministry of War which he had held since 1859 he resigned in 1871 together with the Ministry of Marine, held since 1861. In 1872 he succeeded Bismarck as president of the Prussian Cabinet and was made field-marshal shortly after; but soon resigned. He was author of several works on geography published between 1832 and 1839.

ROOS, Johann Heinrich, German painter: b. Otterberg, in the Palatinate, 27 Oct. 1631; d. Frankfurt-on-Main, 3 Oct. 1685. He went to Amsterdam and applied himself to landscape and animal painting. After a visit to Italy he settled finally at Frankfurt. Most of his works are animal landscapes, executed in the conventional Italian style.

ROOSEVELT, rō'zē-vēlt, Nicholas J., American inventor: b. New York, 27 Dec. 1767; d. Skaneateles, N. Y., 30 July 1854. He engaged in manufacturing and inventing in New York and was connected with Robert R. Livingston and John Stevens in experimental boat-building. In 1798 he conceived the idea of a vertical wheel, a suggestion which made steam navigation a success. The first experiment was made in a boat launched in 1802 and propelled by the vertical wheels. In 1809 he was associated with Fulton in the introduction of steamboats into Western waters and in 1811 built and launched the *New Orleans*, with which he made a pioneer trip down the Ohio and Mississippi rivers in 14 days. He obtained letters patent from the United States government in 1814 protecting his invention, but was denied protection by the New Jersey legislature. Fulton never claimed the invention as his own, and Roosevelt's title to it has never been legally proved.

ROOSEVELT, Robert Barnwell, American author and politician: b. New York, 7 Aug.

1829; d. Sayville, L. I., 14 June 1906. He was admitted to the bar and practised law in New York until 1871, when he was elected to Congress. In 1888 he was appointed Minister to the Netherlands and served two years. He was active in opposing the Tweed ring, and wrote several works of natural history. His most important public service, however, was in the establishment of the United States Fish Commission, of which measure he was the originator and promoter while in Congress.

ROOSEVELT, Theodore, American author, naturalist, explorer, statesman and soldier, and 26th President of the United States: b. New York City, 27 Oct. 1858; d. Sagamore Hill, N. Y., 6 Jan. 1919. He was born at No. 28 East 20th street, New York City. His father (of the same name) was a prominent merchant and a man noted for patriotism, public spirit and enlightened interest in many movements for social betterment. His mother's maiden name was Martha Bullock; she was a native of Georgia and had two brothers who served in the Confederate navy during the Civil War. The Roosevelt family is descended from Klaes Martensen Roosevelt, who came from Holland to what was then "New Amsterdam" in 1644; for seven generations thereafter all of Theodore's paternal ancestors bearing the family name were born on the island of Manhattan, and were well known there as leading citizens. Young Theodore was a sickly child, greatly troubled with asthma and extremely near-sighted; the condition of his health somewhat retarded his education, but he developed, when he was still very young, a passion for serious reading and an intelligent interest in natural history. In 1876 he entered Harvard College and received his degree of bachelor of arts in 1880. Before going to college and while there, as well as afterward, he gave much time to athletic exercises of various kinds and, although seriously handicapped by physical deficiencies, became, by sheer force of will and indomitable perseverance, a good boxer, a good rider and a good marksman, while, by frequently living in the open air and persistence in strenuous exercise, he not only threw off the maladies of his childhood, but became a tireless walker and rider and developed a magnificent physique, able to respond for many years to the exhausting calls he made upon it. While in college he began a History of the Naval War of 1812, which he completed after graduation; this is a work of much greater literary merit than he himself afterward ascribed* to its opening chapters, but the most interesting and significant incident connected with its preparation is the generally admitted fact that he undertook it because he found all the American narratives of that conflict, then current, untrustworthy, prejudiced and unfair to the public enemy; then, as ever throughout his life, his love of truth and fair play was, perhaps, his most striking characteristic; hypocrisy, humbug and obtaining praise through false pretenses were always, for him, the very abomination of desolation.

At the age of 23 he was elected to the New York assembly. Through family tradition and personal conviction he was a Republican, and

* "Those chapters were so dry they would have made a dictionary seem light reading in comparison." "Autobiography," p. 27.

Copyright, Underwood & Underwood, N. Y.

THEODORE ROOSEVELT

The Twenty-sixth President of the United States

his district was normally Republican also; but, two years before, the local bossing, to please the supreme party boss, had caused the nomination and election of a candidate whose record at Albany of unscrupulous subserviency to the boss in question had so disgusted decent people among his constituents as to make the choice of a Democrat reasonably certain, were he renominated by the Republicans. Nevertheless, the boss insisted on his tool's renomination, and the bossing proceeded to obey orders; young Roosevelt reluctantly consented to be a candidate in the primaries, at the urgent entreaty of a local politician named Joe Murray, who pointed out to him how his party was about to suffer defeat merely to promote the discreditable personal ends of its unscrupulous leaders; and, to the great astonishment of these leaders, the supposed stripling was nominated, despite their hostility, and easily elected. In the assembly his independence, courage, devotion to duty, outspoken enmity to corruption in every form and enlightened and fearless efforts to promote practical reforms and truly progressive legislation, in the face of bitter hostility on the part of wealthy "interests" and politicians owned by them, soon made him a figure of national prominence. The sudden deaths of his mother and his first wife within a few hours of each other in February 1884, and the discouraging political outlook after the nomination by the Republicans of James G. Blaine for the Presidency, a nomination which Roosevelt, as a delegate to the National Convention, had sought vainly to prevent, caused his temporary retirement from public life and led him to become for some two years a ranchman in the wild country then given over to cowboys and their herds.

Two years later he returned to New York to accept the Republican nomination for mayor, tendered him principally because the more wealthy and conservative element of his party was alarmed by the candidacy of Henry George, representing an ephemeral "United Labor" organization; Roosevelt was defeated on this occasion, mainly by reason of defections among the same class of his supporters who deemed Abram S. Hewitt, the Tammany nominee, a "safer" mayor for their purposes. In February 1889 he attended a National Conference of Civil Service Reformers in Baltimore and there expressed such outspoken and unqualified devotion to the principles of the merit system that President Harrison appointed him a member of the Civil Service Commission. In this post he made the Civil Service Law a living force for good government and pure politics and himself a source of real terror to politicians who had previously believed, with good reason, and acted on the belief that this statute and the commission it created could be safely ignored and defied by officials having "pull." He remained in office for more than three years after President Cleveland had succeeded President Harrison, resigning to become one of the police commissioners of New York City, appointed by Mayor Strong after the Reform victory of 1894. Here again he showed himself the fearless and inflexible enemy of the many abuses which had become chronic in the New York police, and thereby incurred the rancorous hostility of all those who profited, in one way or another, by these abuses, including many citizens outwardly

reputable and ready to favor reforms so long as these led only to talk, but shocked by Roosevelt's thoroughgoing and practical discharge of his sworn duty. After two years of what he called a "grimy struggle" he was given a new field of useful activity by his appointment as Assistant Secretary of the Navy.

For Roosevelt it was a labor of love to promote the efficiency of the American navy, and to his energy, eminent talents for administration and fervent patriotism the brilliant success of our fleets in the war with Spain must be fairly ascribed in very large measure. He took part in the war, however, in another capacity; as soon as its outbreak became certain he tendered his services as a soldier, was offered the command of a regiment of volunteer cavalry, declined this in view of the superior experience of his old friend, afterward Maj. Gen. Leonard Wood, then a surgeon with a notable record as an Indian-fighter, but accepted a commission as lieutenant-colonel in the same organization, soon to be known as the famous Rough Riders, and served with distinction at the engagement of Las Guasimas and the battle of San Juan Hill. He became colonel of the regiment when Colonel Wood was promoted, was nominated brevet brigadier-general "for gallantry in battle" and was warmly commended by Generals Wheeler, Young, Sumner and Wood and several other officers of rank who were eye-witnesses of his conduct. When his regiment was disbanded he became at once the Republican candidate for governor of New York.

He owed his nomination to the extremity of the bosses and bossings then in control of the party, who at that time hated Roosevelt, but hated yet more their own exclusion from power and its profits, and recognized that he was the only man they could then put up with any hope of victory. The result justified both their forecast and their antipathy, for Roosevelt was elected by a good majority and also proved himself as unsatisfactory a governor, for their purposes, as he had been an assemblyman 17 years before. Especially did he render himself obnoxious to wealthy corporations and to the prominent politicians (both Republicans and Democrats) employed by such corporations by insisting on their paying reasonable taxes on their franchises. As the only means to prevent his obtaining a second term as governor, the leading Republican politicians tried to force and finally succeeded in forcing upon him the nomination for the Vice-Presidency at the National Convention of 1900 in Philadelphia.

It had been the hope of these politicians that, when thus "kicked upstairs," he would be reduced to ornamental impotency; but these calculations were falsified by the murder of President McKinley, and, on 14 Sept. 1901, Theodore Roosevelt took the oath of office as President at the house of Mr. Ansley Wilcox in Buffalo. On 8 Nov. 1904 he was elected to the same office against Judge Alton B. Parker, the Democratic candidate, by 330 electoral votes to 136 and a popular majority of some two millions and a half.

To relate, even in the barest outline, the events of Roosevelt's Presidency would be quite impossible within the limits of this article. His virtually enforced adjustment of the great coal strike, his long struggle, in Congress and the courts, with "trusts" and combinations in re-

straint of trade and actual or threatened monopolies, his successful mediation between Russia and Japan, his restoration of order in Cuba, his vindication of the Monroe Doctrine in the case of Venezuela, his rescue of the Isthmus from Colombia and construction of the Panama Canal, his steadfast and untiring efforts to preserve the public lands from misappropriation and trespass on the part of land thieves, to develop the country's natural resources for the benefit of the people and to detect, root out and punish corruption and breach of trust in all branches of the public service—each of these subjects could be fairly and adequately treated only if it had an article to itself as long as the present. The history of his Presidency was, in short, the history of the United States during seven and a half years of great moment. On the evening of election day 1904 he said publicly that he would not accept a nomination for another term. To this determination he adhered inflexibly in 1908, resisting a tremendous pressure from almost every part of the country, based upon the universal conviction that his nomination and election were absolutely certain if his consent could be obtained, and a large measure of doubt as to whether he could transfer to any other candidate enough of his own immense popularity to assure the latter's choice. He succeeded, however, in bringing about the nomination and election, as his successor, of William Howard Taft, whom he had selected, after very serious consideration and some hesitancy, as on the whole the most suitable among the public men connected with his administration to continue the practical application of his theories and principles in the conduct of the government. A few weeks after Mr. Taft's inauguration Roosevelt started on a hunting trip to East Africa.

On his return he found the Republican party threatened with defeat and the administration gravely discredited by Mr. Taft's complete failure to justify the hopes of those who had secured his nomination and most signally of all, of Roosevelt himself; he found also a general conviction, which every day strengthened, that only his own acceptance of the Republican nomination for the Presidency in 1912 could prevent a Democratic victory. Against both his own inclination and his own judgment he finally yielded to the overwhelming pressure brought upon him, and consented, in his own words, to "cast his hat into the ring." The party primaries gave him an undoubted majority in the convention held at Chicago in June 1912, but the wealthy "interests" which controlled the National Committee, and, through it, the preliminary organization of the convention, and the unscrupulous politicians who did their bidding deliberately preferred defeat at the polls to four years more of Roosevelt, and unseated enough of his delegates to ensure the formal renomination of Mr. Taft. An improvised "Progressive" party, created largely as a protest against the injustice and dishonesty of this nomination, put Roosevelt in the field, and a bitter, three-cornered contest followed; during this a partially demented man, maddened by the violent abuse of Roosevelt's enemies, attempted to kill him at Milwaukee, inflicting a wound which obliged him to remain two weeks in a hospital. At the election Mr. Taft met probably the most humiliating defeat ever experi-

enced by a candidate for the Presidency, carrying only two small States and receiving only eight electoral votes; Roosevelt obtained 80, and a popular vote of over 4,000,000, but the division of the Republicans made inevitable the election of the Democratic candidate, Woodrow Wilson.

In October 1913, Roosevelt sailed for South America to explore a virtually unknown portion of the Brazilian wilderness. This expedition was attended by great dangers and hardships; his party was for months entirely cut off from civilization and suffered terribly from the tropical fevers always lurking in those regions. He was himself so very ill and the whole party so utterly exhausted that he urged them to leave him to die; but his companions, including his son Kermit, refused to do this, and finally succeeded in reaching a frontier settlement. Roosevelt returned to his home in May 1914, and thereafter was outwardly as earnest, as active and as interested in public affairs as he had ever been; but the poison of the South American fever remained in his system, undermined his strength and undoubtedly shortened his life.

Roosevelt's return to the United States was very soon followed by the outbreak of the European War. He had entirely disapproved of President Wilson's policy of "watchful waiting" and inconclusive intermeddling in Mexican affairs, and now found himself yet more radically out of sympathy with the latter's advocacy of "neutrality in thought" respecting Belgium and the settlement underlying his "too proud to fight" speech: moreover Roosevelt had naturally and strongly felt as an unseemly reflection on his own official course that a successor in the Presidency should negotiate a treaty with Colombia apologizing for the action of the United States at Panama. He became more and more critical of the administration as he realized more and more clearly the imminent danger to the United States involved in a possible German victory, and the unwillingness of President Wilson and of the political party then dominant to adopt any adequate measures of preparation for war, or even to resent with dignity and spirit repeated and insolent outrages on our citizens. To bring about Mr. Wilson's defeat in 1916, he refused to run as the Progressive candidate for the Presidency (thereby virtually destroying the short-lived Progressive party), when the same interests and, in the main, the same men responsible for Mr. Taft's candidacy four years before again showed that they preferred their party's defeat to Roosevelt's election, by giving the Republican nomination to Justice Charles E. Hughes. Roosevelt earnestly and whole-heartedly supported Hughes in the ensuing campaign, but his innumerable friends were less forgiving than himself, and their profound dissatisfaction, joined to some clumsy and arrogant blunders on the part of the Republican managers, gave Woodrow Wilson four years more in the White House.

The President's final break with Germany was to Roosevelt a very agreeable surprise. He threw himself with all possible ardor into the advocacy of an energetic participation in the war on our part, and offered to raise a division of volunteers, in which he should him-

self serve as one of the brigadier-generals. He was instantly overwhelmed with applications to serve in the force from all parts of the Union; it is said that more than 250,000 men asked to join it. Congress authorized its organization, notwithstanding strenuous opposition from the President; but the latter refused to avail himself of the authority thus conferred; Roosevelt could not be allowed to return home with a military record.

Roosevelt was bitterly disappointed by this refusal; prevented by the President from serving his country in the field, he did everything in his power to arouse an imperative demand by public opinion for a prosecution of the war with unflinching vigor up to a decisive victory, without regard to the cost and sacrifices involved, and protested with all possible energy against any thought of negotiation or parley with the public enemy; for, with many others, he entertained something more than a suspicion that peace without victory was the secret aim of President Wilson. All four of his sons promptly entered the army and served with distinction; one of the four was killed; two were wounded. When on 25 Oct. 1918, the President appealed to the voters of the Nation to elect a Democratic Congress, as a mark of confidence in himself and approval of his policy, Roosevelt vigorously denounced the President's course, and united with ex-President Taft in urging that the voters should choose "a Congress which will not register the will of one man, but, fresh from the people, will enact the will of the people." The extremely significant result of the election, which, instead of giving the President the vote of confidence he had asked, changed Democratic majorities of 10 in the Senate and five in the House into Republican majorities of 2 in the Senate and 45 in the House was the last of Roosevelt's many political triumphs; and it proved a solace to the last two months of his life. His health, fatally weakened by the results of his South American explorations, had gradually failed during the four busy and exciting years succeeding his return. About midnight on 5 Jan. 1919, he dictated from his sickbed a communication to the chairman of the Republican National Committee; some four hours afterward, he died quietly in his sleep.

Roosevelt's political and public services were but a part of his many activities. He was a very prolific writer; beside innumerable addresses, magazine articles and occasional publications he wrote 'The Winning of the West' a history of the pioneer settlement of our states beyond the Alleghanies; *Lives of Thomas Hart Benson, Gouverneur Morris and Oliver Cromwell*; a 'History of New York'; an 'Autobiography'; 'African Game Trails'; 'Through the Brazilian Wilderness'; and a multitude of other books, some setting forth his theories or narrating his experiences as a naturalist and hunter, some expounding his views on moral, social or economic problems, many devoted to the political issues of the times or defending his opinions (always very pronounced and definite) as to disputed questions of ethics or public policy. He was likewise an indefatigable traveler, and always ready to give the brief holidays allowed him by his literary labors and his public duties to

journeys in wild regions and life in the open. He was twice married, in 1880, to Alice Lee, and, in 1886, to Edith Kermit Carow. By his first marriage, he left one daughter, Alice, the wife of Nicholas Longworth of Ohio; by his second, he left three sons, Theodore, Kermit and Archibald, and one daughter, Ethel, the wife of Dr. Richard Derby of New York; his youngest son, Quentin, had been killed in the war.

Theodore Roosevelt was a man of extraordinary powers and, to those who knew him well and understood him, a man of most attractive character and qualities. Doubtless he was sometimes gravely misunderstood; his mental processes were so abnormally rapid that he often seemed to act with little or no reflection, when he had, in fact, considered the question at issue most thoroughly and conscientiously, although, perhaps, in one-tenth of the time which would have been needed for the purpose by an ordinary man. Moreover the strength of his convictions and the vivacity of his speech and manner confused and frightened timid men or those who knew him but slightly, and led them to think of and describe him as arbitrary and overbearing; he was, in truth, somewhat exceptionally anxious for information, assistance and advice from those for whom he felt respect and in whom he had confidence; but only one who wasn't afraid of him could fairly judge or really like him. He had the stern sense of duty, the lofty purpose and the strict morals of puritanism, without any of its prudishness or pharisaism or intolerance, and, most emphatically, without any of its too common hypocrisy or affectation of virtue. He detested falsehood in every form and shams of every kind, and, throughout his long and stormy career as a public servant and a political leader, always fought fairly and in the open, and was restrained by the instincts of a gentleman and the scruples of a man of honor. It were needless to speak of his patriotism or his courage,—the events of his life sufficiently attest these,—but it is the firm belief of the writer that his profound wisdom, the unselfishness of his devotion to duty and his immense usefulness to his country will be more clearly recognized and more highly esteemed by each successive generation of Americans in our national future.

CHARLES J. BONAPARTE,
Attorney-General in the Cabinet of President Roosevelt.

ROOSEVELT AND THE PROGRESSIVE PARTY. The Progressive movement in the Republican party, like its counterpart in the Democratic party, laid emphasis on the need of freeing government, both State and Federal, from the domination of special interests and the prostitution of government to serve the needs of a small moneyed minority. The fight more especially developed into a struggle against corporations. This struggle has had three principal phases: first, the attempt to control and regulate corporate activities; second, to resist the efforts made by vested corporate interests to exploit the natural resources of the country in their own interest and, third, the revolt against the tariff revision of 1909 which was made in the interests of the same predatory classes. The Sherman Law was the effort made to accomplish the first end; it was not very successful and had a disastrous effect on business. When Roosevelt became President in 1901 he regarded this law as of doubtful efficacy. His chief objection to it was that it failed to discriminate between good corporations and bad corporations, assuming that all combinations were trusts and, therefore, dangerous and to be suppressed. Roosevelt in 1903 prevailed on Congress to establish a Bureau of Corporations in the Department of Commerce and Labor, through which "power and authority," were granted, "to make . . . diligent investigation into the organization, conduct and management of the business of any corporation, joint-stock company or corporate combination engaged in commerce among the several states and with foreign nations."

Roosevelt, however, before the bureau made its reports of the activities of "big business" determined to try out the Sherman Law in the cases of the Standard Oil Company and the American Tobacco Company. While nominally successful the punishment of the delinquent corporations was more apparent than real. The financial panic of 1907 further stayed the President's hand but it was clearly his intention and desire that Taft, his successor, should carry on the work of government control of corporations.

The conservation movement to protect the natural resources of the nation in the interest of all the people and from exploitation by private individuals and interests was the second great objective of the progressive forces during Mr. Roosevelt's incumbency of the White House. The President in March 1907 appointed the Interstate Waterways Commission to investigate conservation as far as the waterways of the country were concerned. A preliminary investigation by the commission caused it to recommend to the President the calling of a conference to discuss conservation from all angles. The result was the memorable conference at the White House on 13 May 1908 and the subsequent appointment of Gifford Pinchot as head of the National Conservation Commission. In the fight to conserve the natural resources of the country Mr. Roosevelt received no aid from the majority of the Congress. Everything possible was done to hamper him and the special private interests were sufficiently powerful to prevent him in his effort to put the conservation movement on a secure basis. The lasting benefit of his struggle was the awakening of public interest in the question which in later years put the movement beyond the power of the special interests and their subservient tools among the politicians.

In endorsing Taft as his successor, Mr. Roosevelt firmly believed that his favorite measures, "his policies," would be carried out faithfully. Roosevelt's disappointment was keen, therefore, when the Payne-Aldrich tariff raised certain schedules upward instead of downward as had been promised by Taft and his political sponsors during the pre-election campaign. Taft's support of Ballinger, his advocacy of a sham reciprocity treaty with Canada and his yielding to the old conservative standpatters and reactionaries made it impossible for the progressive members of his party to support him for re-election in 1912. The tariff discussion of 1909 was the most potent factor in widening the breach between the Progressives and the reactionaries among the Republicans and helped define the progressive movement for the country. An open break with the Taft administration followed and the National Progressive Republican League was formed by the Progressive senators and members of the House of Representatives, pledged to these specific reforms: (1) election of United States senators by popular vote; (2) direct primaries; (3) direct election of delegates to national conventions; (4) initiative, referendum and recall clauses in all State constitutions; and (5) a corrupt practices law with adequate provision for its enforcement. The league grew rapidly and was sufficiently powerful to cause progress and reform legislation to be passed in the last year of the Taft administration. Its growth proved that the Republican party as then constituted had no room for real progressives and either a new party must be created or the old effectively regenerated.

Already in April 1911 the Progressive wing of the Republicans made preparation to ensure the nomination of one of their members in 1912. For a time it appeared that Senator La Follette would be the Progressive leader against reaction in the Republican National Convention of 1912. Certain interests, however, were able to cause his candidacy to be dropped and his followers at once transferred their allegiance to Roosevelt. The latter was less uncompromising than La Follette, having yielded to the special interests whenever he could make an advance by so doing. Good government had no more doughty champion than he and popular rights no advocate more sincere. The contest for the Republican nomination by the spring of 1912 dwindled to a struggle between the followers of Taft and Roosevelt. The contest was one of the most bitter in our political history because of the former close relations existing between the two candidates. The issues, however, were sharply defined. Taft stood forth the champion of privilege while Roosevelt as throughout his career espoused the cause of democracy, or government by the people.

The crisis came at the Chicago Convention of the Republican party, 18-22 June 1912. The delegates to that convention were of three classes according to mode of selection: Those elected by State conventions, those chosen directly by the people and those chosen directly under pledge to vote for designated candidates. The reactionaries under Taft controlled the first or "machine" group; the two other groups were largely controlled by Roosevelt. It was soon observed that the contest

would be close and the fight was soon centred on those delegates whose seats were contested, neither candidate having a clear majority of uncontested seats. The reactionary National Committee, appointed four years before, now proceeded to award the contested seats and adjusted matters so that Taft was ensured a majority. The Progressives claimed that these decisions were made in bad faith, that the nomination was stolen, and they withdrew from the convention. They held a rump convention to discuss future plans. Roosevelt told the delegates to return to their homes, sound the popular sentiment and return to Chicago on 5 August, when if the popular demand should be sufficiently strong, a third party would be established. On 5 August the Progressive delegates met again in Chicago and reported an overwhelming popular demand for a new party opposed to boss rule and machine politics. On 6 August Mr. Roosevelt in what he called his "Confession of Faith" outlined the purposes of the new party, stating that: "the old parties are husks, with no real soul within either, divided on artificial lines, boss-ridden and privilege-controlled, each a jumble of incongruous elements, and neither daring to speak out wisely and fearlessly what should be said on the vital issues of the day." The new Progressive movement he characterized as "a movement of truth, sincerity and wisdom, a movement which proposes to put at the service of all our people the collective power of the people, through their governmental agencies, alike in the Nation and in the several States. . . . We propose to raise aloft a standard to which all honest men can repair, and under which all can fight, no matter what their political differences, if they are content to face the future and no longer to dwell among the dead issues of the past." Roosevelt was nominated for the Presidency and Hiram Johnson of California for Vice-President. The platform of the new party promised the five reforms outlined above as the demands of the National Progressive League and also outlined a program of social and industrial justice, to correct or mitigate the injurious effects incident to our modern industry. Within the three months following the convention the Progressive party organized itself from the national committee down to the local election district and at the November election polled more than 4,000,000 votes—a feat unparalleled in all political history. When the Presidential campaign of 1916 arrived and Mr. Hughes became the Republican candidate, old animosities were laid aside and Mr. Roosevelt and nearly all of his Progressive followers supported the old party, believing rightly that a division would again make for a Democratic victory and four more years of Wilson and Democratic administration. Tactless blunders by a few campaign managers nullified Mr. Roosevelt's efforts and Wilson secured a second term. In October 1919 an intimate friend of Mr. Roosevelt disclosed the fact that the latter was preparing to secure the nomination for the Presidency in 1920, when he prophesied that the standpatters would have to take him and "with a larger dose" of reform than in 1904. His untimely death removed America's most progressive and most earnest leader; perhaps,

the only man who was able to place a strong government in Washington instead of a cabal of theorists and impractical idealists. Consult La Follette, R. M., 'Autobiography' (1918); Roosevelt, Theodore, 'Thou Shalt Not Steal' (in the *Outlook* of 12 July 1913); id. 'Progressive Principles,' edited by Elmer H. Youngman (New York 1913); De Witt, B. P., 'The Progressive Movement' (ib. 1915); Walling, W. E., 'Progressivism— and After' (ib. 1914); *New York Times* of 17 Oct. 1919; *Literary Digest* of 18 Oct. 1919.

ROOSEVELT. N. J., borough in Middlesex County, on Rahway River and Staten Island Sound, 16 miles from New York, on the Central of New Jersey Railroad. It gained its present name and status in 1906 when the districts Carteret, Chrome and East Rahway were united in one borough. It has deep sea water frontage and is chiefly a manufacturing city. Its industries include steel works and the manufacture of metal goods, fertilizers, chemicals, cigars, etc. Pop. 5,786.

ROOSEVELT DAM, the greatest engineering work in connection with the Salt River irrigation project in Arizona, which ranks first among the works of the United States reclamation service, was completed in 1910. This wonderful structure of sandstone and cement, costing nearly \$9,000,000, rises 284 feet above Salt River, about 75 miles northeast of Phoenix. It is 1,080 feet long on top and 170 feet thick at the base. Placed by the side of a 20-story building, it would rise 10 feet above it, while its length on top would be equal to four blocks on Broadway, New York City. Across its top is a roadway 20 feet wide. The structure is set in a mountain gorge, being in the form of a huge W, closed at the top and bottom, and curved with a bulge up-stream so as to present an arched resistance to the great body of water it has to withhold. Very large stone is used in the dam wall, technically "cyclopean," and this is securely bonded together and filled in with Portland cement, thus solidifying it into a great monolith. The discharge is through a 500-foot tunnel to six great service gates, each of which will discharge 1,670 cubic feet of water per second. Spillways carry the surplus water around the dam, and serve to relieve it in time of flood. The reservoir created by the Roosevelt dam is the largest artificial body of water in the world. Its capacity is 61,000,000,000 cubic feet, and if its water were spread over the State of Delaware it would cover the entire surface of the State a foot in depth. The lake formed by the dam is 25 miles long, and at its greatest two miles wide. It was formally opened by Theodore Roosevelt 18 March 1911.

ROOSEVELT MILITARY HIGHWAY, Oregon. On 3 June 1919 the Oregon legislature passed a measure for the issuance of \$2,500,000, provided the Federal government appropriated a similar amount, in order to construct a great highway running along the entire coast of Oregon from the mouth of the Columbia River to the boundary of California, which State has expressed the intention of continuing the road along its coast. The entire highway through both of the States is named in honor of the late Colonel Roosevelt. An association has been formed in the State of Washington to further the scheme, so that, if carried through,

the highway will spread along the entire Pacific seaboard of the United States. It is pointed out that the coast of Oregon presents rare attractions to the tourist in its rugged grandeur of scenery, flora and wild fauna.

ROOT, root or rut, **Elihu**, American lawyer and statesman: b. Clinton, N. Y., 15 Feb. 1845. He was graduated at Hamilton College in 1864, and at the New York University Law School in 1867. In the latter year he was admitted to the bar and entered upon the practice of his profession in New York. In 1883 he was appointed United States District Attorney for the southern district of New York; in 1894 was a delegate-at-large to the New York State Constitutional Convention, and was chairman of the judiciary committee. He was appointed Secretary of War by President McKinley in 1899 and reappointed in 1901. He found the work of his department in disorder, with constant rivalry among its various bureaus, but by strict discipline, adherence to civil service rules, and establishing a system of promotion for merit, he soon brought order into the administrative departments, and turned his attention to the organization of the army. In this field he brought about a number of improvements, chief among which are the assimilation of the militia with the regular army and the creation of the General Staff. He also had charge of the military administration of Cuba and the Philippines; and while he was severely criticised for not trying to prevent cruelties in the conquest of the Philippines, he must be given credit for the policy of the army in enforcing sanitary measures and preparing for independent government in Cuba; and for the restoration of order and preparation for civil government and the work of the Philippine Commission in the Philippines. In January 1914 he retired from the secretaryship to resume the practice of law. On 19 July 1905 he was appointed Secretary of State. In 1909 he was elected United States senator from New York, but in 1913 declined to serve further. In 1912 he was permanent chairman of the Republican National Convention at Chicago. He was honored with the 1912 Nobel Peace Prize. In 1915 he presided at the sessions of the New York State Constitutional Convention and in 1916 received 103 votes for the Republican nomination for President of the United States. In 1917 he headed a commission sent by the United States to advise with the Russian government. He has served as president of the Union League Club of New York, the American Bar Association, the American Society of International Law, the board of trustees of the Carnegie Institution at Washington and numerous other distinguished bodies. He has received many eminent degrees from American and foreign universities and societies.

ROOT, **George Frederick**, American musician and composer: b. Sheffield, Mass., 30 Aug. 1820; d. Bailey's Island, Me., 6 Aug. 1896. He was self-taught in his earlier years, but later studied under George J. Webb in Boston. He was instructor in music in the schools of Boston in 1839-44, and director of two churches there. He taught music in New York in 1844-45; studied at Paris in 1850, and afterward was chiefly engaged in composition. From 1859 he was senior member of the Chicago music pub-

lishing firm, Root and Cady. Among his many successes are the songs 'Rosalie, the Prairie Flower'; 'The Battle Cry of Freedom'; 'Tramp, Tramp, Tramp, the Boys are Marching'; 'Just Before the Battle, Mother'; the quartet, 'There's Music in the Air,' and the cantatas 'The Fower Queen' (1852) and 'The Haymakers' (1857).

ROOT, that plant part which normally penetrates the soil, absorbs water and chemicals in solution, for nutritive purposes, forces it through the plant and also acts as an anchor and support. Roots, however, in modified forms, may draw nutriment from other vegetation or from the air, and may even serve as support and aid to climbing-plants. Low forms of vegetation and certain submerged aquatics able to absorb water through most of their tissues have no roots, or only enough to act as anchors.

The primary form of root is that which secures the germinating seed to the ground and strikes downward into the soil, sending off branches which rebranch until the ground occupied by the fibrous reticulation is thoroughly exhausted of food. In many cases, however, this single central tap-root, so-called, is missing, and numerous horizontal and lateral roots take its place. The growth of the root-system is commensurate with that of the plant above ground. In epiphytes the roots either adhere to the site of the plant, to hold it in place, or depend freely in the air, drawing nourishment therefrom.

Plants are called annuals, biennials or perennials, according to the length of time the root lives, but the differences are not always absolute, and are often changed by cultivation. Perennials, such as quack grass and peony, often have thickened, tuber-like roots, in which nourishment is stored during the growing periods, to be drawn upon when the plant flowers. Biennials such as beets and carrots show similar development.

Each root is a naked organ, incapable of bearing leaves, which has a blunt apex shielded by a root-"cap" more or less distinct, of old and firm cells. The growing cells of the root lie directly behind this cap, and still farther back is a zone of delicate tubular, one-celled root-hairs, which are devoted to the absorption of liquid foods from the soil and are constantly dying off and being renewed on the side next the root-cap. The growing tip with cap and root-hairs continually advances through the soil, while the older portions become inactive so far as absorption is concerned, thicken, envelop themselves in cork and increase their means of conducting water from the region of the root-hairs to the rest of the plant.

Roots may be produced from stem parts (easiest at the nodes) or even leaves as in *Bryophyllum* and *Begonia*. They are then called adventitious. Familiar examples of adventitious roots are the aerial roots of banyan and mangrove, which start from the branches and eventually penetrate the ground. These roots not only assist in feeding the trees, but also help to support their gigantic heads. Vines, such as the poison-ivy, have masses of aerial rootlets which spring from and fasten the stem firmly to its support.

The haustoria of certain parasitic plants,

such as dodder (*Cuscuta*), are forms of reduced roots. They are special organs of absorption which develop from the tissues of the parasite and penetrate the body of the host plant either by means of solvent ferments or the pressure resulting from their own growth or both combined. Once there, they draw sustenance from their host and often dispense with assimilative organs of their own.

Other parasites have disc-like haustoria upon their root-systems, which fasten upon the roots of other plants. Although appearing above ground like self-supporting herbs with green foliage, vigorously assimilative, these plants do not reach full development without this clandestine connection. The young roots of saprophytes, or plants living upon the decaying remains of vegetation, seem to require the co-operation of fungi in obtaining food.

The symbiotic connection of bacteria and leguminous plants is well known. The bacteria penetrate through the root-hairs of the *Leguminosae* into the cortex of the root and there raise tubercular growths. They draw upon the carbohydrates developed by the host, but being capable of fixing free nitrogen, they exchange this element in elaborated form to the host plant. By plowing the legumes under the ground they decay, returning the nitrogen to the soil in a form available for the next crop. This process, called green manuring, is a good treatment, especially for exhausted, non-nitrogenous soils.

ROOT, in philology. See SCIENCE OF LANGUAGE.

ROOT-WORM. See GRAPE INSECT-PESTS.

ROPE. See CORDAGE.

ROPES, Arthur Reed ("ADRIAN ROSS"), English dramatist and poet: b. Lewisham, Kent, 23 Dec. 1859. He was educated at Cambridge. Among his numerous dramatic productions are 'Faddimer' (1889); 'In Town' (1892); 'Gaiety: a Greek Slave' (1898); 'San Toy' (1899); 'The Messenger Boy' (1900); 'Gaiety: a Country Girl' (1902). He also published 'Poems' (1884); 'Short History of Europe' (1889); 'On Peter's Island,' with Mary E. Ropes (1901), etc.

ROPES, John Codman, American military historian: b. Saint Petersburg, Russia, 28 April 1836; d. Boston, Mass., 28 Oct. 1899. He was graduated at Harvard in 1857, and from his admission to the bar in 1861 until 1870 practised law in Boston, but devoted the remainder of his life to historical writing. As the founder of the Military Historical Society of Massachusetts he started the movement for the collection of historical data relating to the Civil War by the United States government. He spent much time also in the collection of material bearing upon the life of Napoleon. His published books are 'The Army Under Pope' (1881); 'The First Napoleon' (1885); 'The Campaign of Waterloo' (1893-94), and 'The Story of the Civil War' (1894-99).

ROPS, rôps, Félicien, Belgian artist: b. Namur, 1833; d. 1898. His illustrations for the *Crocodile*, a journal published at Brussels, appeared for the first time in 1855 and established his reputation as an artist of original genius. But his main employment from that date was book illustration, and many novels of the day

have been published with his brilliant pictures, which reflect the cynical spirit of some modern literature with great imaginative power. Many of his drawings are, however, too sheerly naked and unreserved to be pleasing. But his etchings are almost unique in power of execution, especially the series known as 'Sataniques' which while they belong to decadent art are masterpieces of technique. He founded the International Society of Etchers at Brussels and has had a great influence on modern schools of art in Europe. Consult Ramiro, 'Catalogue de l'Œuvre Gravé de Félicien Rops' (1887), and Mascha, 'Catalogue' (Munich 1910).

ROQUE, rôk. Croquet and roque are two varieties of the same game. Croquet is played upon a grass lawn on which the boundaries of a rectangular court are indicated by a chalk line or by a slight ridge. Roque, however, is a much more scientific variety of the game. The court is 72 feet long and 32 feet wide, rectangular, with each corner, for eight feet, cut off diagonally. The surface is well-rolled dirt sprinkled with sand. It is surrounded with rubber cushions so that caroms can be made off the balls the same as they are in billiards. All the arches, of which there are eight, are three and a half inches in diameter. In the centre of the court is a tunnel or cage the arch of which is three and one-eighth inches, and it is 18 inches in length. The balls are of hard rubber and are three and a quarter inches in diameter. The mallets' heads are seven and a half inches long by two and a quarter to two and a half inches in diameter, with a handle from 8 to 15 inches long. Only two players play against each other, each playing two balls. A national championship is held annually in the United States. See CROQUET.

ROQUEFORT, rôk-fôr, France, a village in the department of Aveyron in the vicinity of which large quantities of the well-known variety of cheese of the same name are made from ewe milk. Pop. 1,150.

ROQUEPLAN, Joseph Etienne Camille, zhô-zéf â-tê-ên kâ-mêl rôk-plân, French painter: b. Mallemort, Bouches-du-Rhône, France, 1802; d. 1855. He studied at Paris under Gros and Pujol. His two pictures exhibited at the Salon of 1827 and illustrative of Sir Walter Scott's writings won him a place among the leaders of modern French painting. His most remarkable works include 'The Amateur Antiquary,' and 'The Well Near the Tall Fig-Tree.' He was equally successful in genre and landscape, and his faithful transcripts of Pyrenean scenery are among the most delightful of modern French pictures.

ROQUETTE, rô-kêr', Otto, German author, critic and poet: b. Krotoschin, Posen, 19 April 1824; d. Darmstadt, 18 March 1896. Educated at Heidelberg, Berlin and Halle, he taught at Dresden until his 39th year, at Berlin in 1862-69, and then in the Darmstadt Technische Hochschule, where he was professor of German language, literature and history. He wrote an excellent history of German literature (1872; 4th ed., 1882); the novels, 'Im Haus der Väter,' 'Das Buchstabirbuch der Leidenschaft' and 'Die Prophetenschule'; two volumes of dramatic poems (1867-76). His alle-

goric tales in verse, 'Waldmeisters Brautfahrt' (77th ed., 1905), was his greatest and most popular work. It was followed by other lyrics and tales. Consult his autobiography, 'Siebzig Jahre' (Darmstadt 1893).

RORAIMA, rō-rā'ē-mā, a mountain of South America, in lat. 5° N., on the boundary of British Guiana and Venezuela, part of the Pacaraima range. It is 8,740 feet high, the top forming a rugged rocky plateau, and the steep rocky sides render the summit almost inaccessible. It was ascended in 1884 by Im Thurn. The flora and fauna of the summit are scanty.

RORER, Sarah Tyson, American teacher of domestic science: b. Richboro, Pa., 18 Oct. 1849. She was graduated from the academy at East Aurora, N. Y., and was married in 1871 to W. A. Rorer. She was for many years principal of the Philadelphia School of Domestic Science, and she lectured widely. She was editor and part owner of *Table Talk* in 1886-92, edited *Household News* in 1893-97 and was later on the editorial staff of the *Ladies' Home Journal*. She was a director of the Pennsylvania Chautauqua School of Domestic Science. Her publications include 'Mrs. Rorer's New Cook Book'; 'How to Use a Chafing Dish'; 'Colonial Cookery'; 'A Book on Diet and Cookery,' etc.

RORIC FIGURES (Fr. *figues roriques*, from Lat. *ros*, dew), a name applied to certain curious images rendered manifest upon breathing on polished solid surfaces, when these have been previously exposed to contact or close proximity of the objects thus represented, and at the same time have been acted upon by light, heat or electricity. The singularity of these phenomena is, that they consist usually in the production at the first of a sort of latent or invisible image, but this may afterward be developed or brought out, somewhat in the manner of photography. Consult Chwolson, O. D., 'Lehrbuch der Physik' (1902).

RORKES (rōrks) **DRIFT**, Africa, a post station on the Tugela River, in Natal, memorable for the heroic defense of a British force of 80 men under Lieutenants Bromhead and Chard. They were guarding the hospital and the commissariat, when they were attacked by a Zulu force of 4,000, the night of 22 Jan. 1879. The British used biscuit boxes and rice bags for a barricade and kept the enemy at bay until relieved the morning of the 23d. Six times in succession the little force drove out Zulu warriors who had got within the barricade.

RORQUAL, rōr'qwal, a name of Scandinavian origin, signifying a whale having longitudinal furrows on the belly. As generally employed it comprises the finback, sulphurbottom and humpback whales, or the subfamily *Balanopterida*, exclusive of the genus *Rhachinaeetes*. The furrows extend to the throat, where they are closely laid. All these whales have small heads and small flippers. In the north Atlantic there are three species of finbacks, one species of sulphurbottom and one species of humpback. The finbacks are the common finback (*Balanoptera physalus*), the pollack whale (*B. borealis*) and the little piked whale (*B. acuto-rostrata*). The whale which is most frequently seen on the east coast of the United States and of which stranded individ-

uals are found every year at different points is the common finback, *B. physalus*. It is from 60 to 70 feet long when full-grown, and is readily distinguishable by its gray and white striped, whalebone, gray upper surfaces and white belly and under surfaces of pectoral fins and flukes. The dorsal fin, which is rather more than a foot high, is situated a little in advance of the last fourth of the length of the body. Though numerous species of finbacks and humpbacks have been described from different parts of the world, the five forms above mentioned are everywhere recognizable. If others exist they at least resemble these very closely. The sulphurbottom feeds on small crustaceans and the finbacks and humpbacks on various fishes, such as the cod, pollack, herring, capelin, etc. They all engage in seasonal migrations. During the summer months great numbers congregate about Newfoundland, Iceland and the north of Norway. For gray whale, or hardhead, and further information relating to finbacks and humpbacks, see **WHALE**.

RORY O'MORE, rōr'ī o-mor', a novel by Samuel Lover, published in 1836. In spite of its stilted style and improbable incidents, this story is valuable in its delineation of Irish character and in its picture of the Irish uprisings at the close of the 18th century.

ROSA, Edward Bennett, American physicist: b. Rogersville, N. Y., 4 Oct. 1861. He was graduated at Wesleyan University in 1886 and took his Ph.D. at Johns Hopkins in 1891. He was professor of physics at Wesleyan University in 1891-1902; physicist of the National Bureau of Standards in 1901-10, and has since been its chief physicist. He has contributed to American and European journals of physics, and is author of the papers of the National Bureau of Standards, in which he has instituted a special department of theoretical and applied electricity and electrical measurements. In 1915 he was appointed a member of the United States Coast Defense Board. He wrote 'The Specific Inductive Capacity of Electrolytes' (1892); 'Descriptions of a New Respiratory Calorimetre' (1899), etc.

ROSA, Francisco de Paula Martinez de la, Spanish poet, novelist, dramatist and statesman: b. Granada, 10 March 1788; d. Madrid, 7 Feb. 1862. Graduating in law from the University of Granada he became lecturer on ethics at his alma mater, while still in his 'teens. He was popular as a lecturer on account of his originality in the handling of his subjects, his enthusiasm and his wide knowledge of literature. He had scarcely entered upon his duties at the university when he began the publication of a series of epigrams on well-known local personages, under the title of 'El cementerio de momo.' This gained him considerable reputation as a writer. But his university and other duties were interrupted by the arrival of the French in Spain. De la Rosa became very active in the national movement against the invaders. Deep in the councils of the Junta of Granada, he undertook for that body to secure arms from the English who were busy fighting Napoleon. In complying with this self-imposed task, he went first to Gibraltar and then to England. He was possessed of notable oratorical gifts and this enabled him to exercise a certain amount of influence in political juntas,

which his otherwise retiring character would not have permitted him to do. This in turn brought for him political offices and a leadership in literature which he was not in reality able to maintain in his later years. Yet this combination of circumstances had two directly opposite effects. It gained for him during his lifetime the reputation of being in his day Spain's greatest and most representative literary man and gave him the literary leadership of his country. This latter position he maintained not so much through his gifts of originality in thought, literary form and subject matter, as by his successful imitation of his favorite authors not in Spanish alone, but also in foreign languages, more especially French and English. The second effect has been that since his death and in consequence of the public and political glamor that surrounded his name in his lifetime his works have become largely neglected; and they have found more critics to pick flaws in them than to recognize their many good qualities. For his political activities and especially for his advocacy of the constitution of 1812, Martínez de la Rosa was tried and sentenced to imprisonment for 10 years, on the political reaction of 1814. He served six years of this sentence which was cut short by the insurrection of 1820. He came forth from his prison to become head of the new ministry; but he proved himself far too weak a character for the stormy part to which fate had assigned him, and his temporizing attitude made him very unpopular and distrusted by both political parties and by the masses as a whole. Resigning office, he went to Paris, where he remained until 1830. Four years later he became head of the liberal ministry. In this capacity he showed his reactionary tendencies by becoming author of a royal statute creating a constitutional government and doing away with the ancient privileges of the provinces. Active though he was in promoting the interests of Spain, he succeeded in making himself fully as unpopular as he had during his first term as head of the government; and he was again forced to resign his office, this time before the end of his first year of service. He, however, continued to be a supporter of the queen, Maria Christina, and on the fall of her government in 1840 he retreated to Paris. He returned to Madrid four years later, as the result of political changes, entered the cabinet of Narvaez (1844), and three years later became Ambassador to Paris (1847-51). His long residence in the French capital made him a champion of the Romantic movement in literature, which he was instrumental in introducing into Spain. Martínez de la Rosa was very sensitive to the influence of his favorite authors, and he reflects them in turn, as one after another obtained ascendancy over him. For this reason he was well fitted for the task of introducing his countrymen to the literary movement that had taken possession of the French capital and through it of all France. Experimenting, as he constantly was, with the works of others, his literary efforts increased in excellence toward the close of his life. Among his published works most worthy of attention are 'Doña Isabel de Solís' (an imitation of Scott); 'La viuda de Padilla'; 'Los celos infundados'; 'La conjuración de Venecia'; 'Aben-Humeya'; 'Lo que puede un empleo,'

and 'Espíritu del siglo.' Consult Godard, 'Martínez de la Rosa' (Paris 1862).

ROSA, rō'sā, Salvatore or **Salvator**, Italian painter: b. Renella, near Naples, 20 June 1615; d. Rome, 15 March 1673. His eldest sister having married Francesco Fracanzano, a painter, Salvator from him acquired a taste for art. He then became a pupil of Falcone and Ribera (q.v.); but his taste was formed by the study of nature among the wilds of the Apennines rather than by other artists. During one of his rambles in the Abruzzi he was seized by brigands with whom he is said to have associated for some time, but left them at last and went to Naples, where he worked in such want that he was often obliged to sell his pictures to the meanest hucksters and for a pittance. At last one of his pictures was observed by the painter Lanfranco who recommended Salvator to notice, and procured him patronage. He removed to Rome, where he established his reputation. In 1647, when the revolt under Masaniello occurred, he joined *La Compagnia della Morte*, which Falcone commanded, and on the defeat of the cause he returned to Rome, where he was not, however, permitted to remain. He went to Florence, where he was patronized and employed by the grand duke and other members of the family of Medici. At length, returning to Rome on the death of his enemies, he painted many pictures for the churches in that city. His great ambition was to be a famous historical painter, but he is actually best known as a painter of landscapes and battles. His landscapes present wild and desolate scenery, with rocks rising like towers; broken, splintered tree trunks waving their leafless arms; storm and lightning convulsing the heavens. The figures introduced are those of bandits, soldiers or witches. Among his extant works are 'Prometheus,' 'Belisarius,' 'Saint Roche Wounded,' some landscapes and battle-scenes, in Rome; 'Jesus Disputing with the Doctors,' 'Daniel in the Lion's Den,' 'Jesus Walking on the Water,' in Naples; 'Souls in Purgatory,' in Milan; 'Conspiracy of Catiline,' and his own portrait, in Florence; 'The Soldiers of Gideon,' 'Bandits in Council,' 'Saint Jerome in the Desert,' and some landscapes, in Munich; 'Mercury and the Woodman,' 'Landscape with Figures,' in the National Gallery; 'Moses at the Rock,' 'Halt of the Soldiers,' at Hampton Court; 'Prometheus,' 'Sisyphus,' at The Hague; 'Regulus,' 'Cadmus,' at Copenhagen; 'The Prodigal Son,' in Petrograd; 'The Angel Raphael,' 'The Young Tobias,' 'The Shade of Samuel Appearing to Saul,' in the Louvre; 'Jesus in the Garden of Olives,' 'Resurrection of Christ,' in Toulouse. He was also distinguished as a poet and musician, and his satires and other poems have been often printed.

ROSA, Monte, mōn'tē rō'sā (ancient **MONS SYLVIVS**), a mountain of the Alps (q.v.), on the boundary between Italy and Switzerland, near the Matterhorn, and about 40 miles east of Mont Blanc (q.v.). It is formed by the union of several mountain ridges. Where the ridges meet four chief angles are formed, the one on the northeast, which is most precipitous, enclosing the glacier of Macugnaga, another on the northwest originating the great Gorner glacier or glacier of Zermatt, a third on the southwest containing the glacier of Lys, and

the fourth on the southeast occupied by several large but less prominent glaciers. The loftiest peak, Dufourspitze, 15,217 feet in height, was first ascended in 1855. There are three other peaks, respectively, 15,132, 15,005 and 14,965 feet high.

ROSA AMERICANA, in *numismatics*, the name applied to a coinage issued in 1722 by Great Britain for America of a mixed metal resembling brass, and called *Rosa Americana* or Wood's money, after its manufacturer, William Wood. The royal letters patent described this money as two-pence, pence and half-pence. See **NUMISMATICS**.

ROSACEÆ, rō-sā'sē-ē, the Rose family, perhaps the most important natural order of fruit-bearing plants, since it includes apple, pear, quince, peach, plum, apricot, cherry, nectarine, raspberry, dewberry, loganberry, blackberry, strawberry, loquat, medlar and countless ornamental trees and shrubs. The family is composed of about 90 genera and 1,500 species widely distributed throughout the world, though most abundant in the north temperate zone. It is divided into six sub-families, which by some authors are considered as distinct families. The basis of subdivision is the formation of the fruit as follows: Fruit follicular, as in *Spiræa*; ovary compound, inferior, fruit fleshy as in *Pyrus*; fruit of achenes as in *Rubus*; carpels connate and adnate to the hollow dry receptacle, as in *Geum*; carpel solitary, superior, fruit a drupe, style terminal, as in *Prunus*; carpel solitary, superior, fruit a drupe but style basal and flowers usually irregular, as in *Chrysobalanus*. The species agree in having alternate, simple or compound leaves, accompanied by two persistent stipules, a calyx of one sepal, with four or five divisions, and the corolla with as many petals as the calyx has divisions, but sometimes wanting. The stamens are generally very numerous and distinct, and are inserted with the petals round the ovary. The pistil presents various modifications. Sometimes it is formed of a single carpel or several entirely free and distinct carpels, placed in a tubular calyx. Sometimes these carpels adhere by their outer side to the calyx; sometimes they are united, not only to the calyx but to each other, and sometimes they are collected into a kind of capitulum or head. The fruits, consequently, are highly varied, and their modifications afford the chief distinguishing marks of the suborders.

ROSACEA, ACNE ROSACEA, or **GUTTA ROSEA**. See **ACNE**.

ROSALES, rō-sā'lēs, Philippines, pueblo, province of Neuva Ecija, Luzon, on a tributary of the Agno River, two miles from its junction with the Agno, 38 miles north of San Isidro. It is connected by highway with Manila and with towns to the north. Pop. 11,519.

ROSAMOND, rōz'a-mōnd, English mistress of Henry II, commonly called "fair Rosamond." She was the daughter of Walter, Lord Clifford, became the mistress of Henry II and died probably about 1176. The king is said to have set apart for her residence a building surrounded by a labyrinth at Woodstock. The intrigue was finally discovered by the jealous Queen Eleanor, who forced her to drink poison. These details, however, have no historic basis.

She was buried in the chapter-house of Godstowe nunnery, where her tomb was long to be seen.

ROSANILINE, a derivative of aniline (q.v.), the base of magenta, fuchsine (qq.v.), etc. It is a colorless substance, having the formula $C_{12}H_8N_4$. Many of its crystalline salts are of very brilliant colors.

ROSANOFF, Martin André, American chemist: b. Nikolaieff, Russia, 28 Dec. 1874. He was educated at the Imperial Classical Gymnasium, Nikolaieff, and at the universities of New York, Berlin and Paris. He was research assistant to Thomas A. Edison in 1903-04; instructor, and later head, of the department of chemistry, at New York University in 1904-07, and was head of the department of chemistry and the chemical laboratories at Clark University in 1907-14. He was called to the chair of chemical research at the University of Pittsburgh in 1914, and since 1915 has also been head of the department of research in pure chemistry there.

ROSARIO, rō-sā'rō-ō, Argentina, in the province of Santa Fé, on the right bank of the Paraná, lies about 230 miles by river northwest of Buenos Aires. It is the second city of the republic in commercial importance and the centre of the entire trade for the 11 provinces lying between Paraná and the Andes. It is the largest river port in the Argentine. Six railways meet here, and river navigation is well developed. Grain elevators and large warehouses accommodate the wheat, hides and produce from the interior. The city is well laid out, on level ground, and has sewers, waterworks, electricity, gas and all modern improvements. There are 18 banks and private bankers, and good newspapers. Many handsome buildings are of recent construction, such as the new courts, theatre, banks and hotels. The residence sections are attractive and finely kept. There are sugar refineries, grist mills and breweries. A large amount of money has been expended in conveniences for transfer of freight from water to rail, and the port trade has responded with a rapid development. The foreign trade approximates \$100,000,000 annually. The most important items of import are lumber, oil, machinery and canned goods. Pop. about 200,000.

ROSARIO, Philippines, pueblo, province of Batangas, on the southeastern coast at the mouth of the Rosario River, 13 miles northeast of Batangas, the provincial capital. It is an important road centre. During the last insurrection the town was destroyed by the insurgents. Pop. 12,450.

Also the name of two smaller pueblos in Luzon: (1) in the province of Cavite, on the Manila coast road, eight miles southwest of the town of Cavite, pop. 6,390; (2) in the province of Union, situated in a mountainous district, 30 miles southeast of San Fernando, connected with coast highway; pop. 2,250.

ROSARY OF THE BLESSED VIRGIN MARY, a form of devotion in the Catholic Church, which consists in the recital of 15 decades of Aves (see **AVE MARIA**) each decade preceded by a Paternoster and followed by a Gloria (see **DOXOLOGY**). As the prayers are said they are counted off on a string of beads. Five decades form a chaplet and in each chaplet

are contemplated events or "mysteries" connected with the life of Christ: the mysteries of the first chaplet are the Annunciation, Visitation, Birth of Christ, his Presentation in the Temple and his Finding there: these are the Joyful Mysteries. In the other chaplets are contemplated the Five Sorrowful Mysteries—the Agony in the Garden, Scourging, etc.; and finally the Five Glorious Mysteries—Resurrection, Ascension, etc. The Rosary of 15 decades was introduced by Saint Dominic in the 13th century.

ROSARY SUNDAY, the first Sunday in October; a feast instituted by Gregory XIII for the Confraternity of the Rosary and made of universal observance after the victory of the Emperor Charles VI over the Turks at Lepanto in 1571 in gratitude to the Blessed Virgin. This victory is supposed to be in answer to the prayers of the Fraternity of the Rosary, a Roman Catholic order established in the 15th century for the purpose of averting public calamity by the means of prayers. An impetus was also given to the devotion of the rosary by Leo XIII, who enjoined its daily use in public during October. Roses are blessed and distributed as souvenirs and the rosary is recited continually during the day.

ROSAS, Juan Manuel de, hoo-än' mā-noo-ël dā rō-sās, Argentine dictator: b. Buenos Aires, 30 March 1793; d. near Southampton, England, 14 March 1877. He was descended from a noble family of Spain and first came into public notice as leader of the Republicans against the Aristocratic party of the Unitarios. He was commander of the police of Buenos Aires in 1826, but the revolution headed by Lavalle forced him to retire. He succeeded a little later in overcoming Lavalle and becoming governor, 1829-32. Though forced out of office, he held control of the army and in 1835 became dictator for five years. His appointment was twice renewed and until 1852 no meetings were held of the National Congress or the Constituent Assembly. Rosas exercised a despotic rule and attempted to annex the neighboring states by force under the pretext of their formerly belonging to the vice-royalty of Buenos Aires. He took advantage of the rivalry of Oribe and Rivera to intervene in the affairs of Uruguay, made an unsuccessful invasion in 1839 after the fall of Oribe's government and repeated the attack in 1843. A long siege followed with the closing of the Paraná to navigation and the violation of the treaties of 1828 and 1840 finally led to combined interference on the part of England and France. Buenos Aires was blockaded, but little was effected save the opening of the Paraná, as the river provinces could not be induced to rise against Rosas. England withdrew in July 1848 and France six months later. The opposition party against Rosas was growing more powerful, however, and the treaty of 1849 which denied to the neighboring provinces navigation privileges of the Plate, the Uruguay and the Paraná finally brought to his opponents the support of Brazil, and Rosas was defeated at Monte Caseros, 3 Feb. 1852. He made his escape to England, where he lived the remainder of his life. The Argentine Congress passed sentence of death upon him in 1861 as "a professional murderer and robber." Consult

Mejia, Ramos, 'Rosas y su tiempo' (2 vols., Buenos Aires 1907).

ROSCELIN, rōs-ël-än, **ROUSSELIN**, or **RUCELIN**, Jean, French theologian of the 11th century: b. probably in the diocese of Soissons. He was educated at Rheims, and came into public notice while canon of Compiègne by citing Anselm as supporting his view of the Trinity, which in effect conceived God as existing as an individual and consequently the Trinity as three Gods. The synod of Soissons in 1092 compelled Roscelin to recant, after receiving from Anselm a refutation and denial of Roscelin's position and claims. Continuing to teach his peculiar views, he was deposed. He went to England to attack Anselm, then archbishop of Canterbury, at the opportune moment of his difference with the king, but failing in his purpose returned to France. Later he settled at Tours and entered into a controversy with Abelard, his former pupil, on the grounds taken by the latter in maintaining the unity of the Trinity. After this controversy Roscelin disappears from history. Of his writings only a letter to Abelard is extant. In the history of philosophy he is classified as a nominalist and in theology as a tritheist.

ROSCHER, rōsh'ēr, **Wilhelm**, German political economist: b. Hanover, 21 Oct. 1817; d. Leipzig, 4 June 1894. Following Savigny, who introduced into Germany the historical treatment of jurisprudence, Roscher broke with the theoretical economists and entered on the study of the history of economics, treating political economy less as an abstract science and more as a branch of history, and making economic fact and past development rank as mere economic ideas and theories. From 1848 he was professor at Leipzig. His two great works are 'System der Volkswirtschaft' (5 vols., 1854-81) and 'Geschichte der Nationalökonomik in Deutschland' (1874). Other volumes on forestry, commerce, charities, etc., were 'Zur Geschichte der englischen Volkswirtschaftslehre' (1852); 'Ueber Kornhandel und Teuerungspolitik' (3d ed., 1852); 'Kolonien Kolonialpolitik, und Auswanderung' (3d ed., 1885); 'Ansichten der Volkswirtschaft aus dem geschichtlichen Standpunkt' (1861; 3d ed., 1878); 'Politik' (1892); 'Geistliche Gedanken eines Nationalökonomens' (1894).

ROSCIUS, rōsh'ī-ūs, Roman actor: b. Colonium, near Lanuvium, 134 a.c.; d. about 61 a.c. He was born a slave and early adopted the histrionic profession for his master's profit. His success on the stage was phenomenal. It is said that at one time he earned 1,000 denarii (about \$175) daily, and Pliny estimates his annual profits at 50,000,000 sesterces (about \$2,000,000). This may be exaggerated, but he was a favorite actor at a period when the Roman passion for the stage was at its height. He was easily enabled to purchase his freedom from his *peculium*, or perquisites as a slave, took the name of Quintus Roscius Gallus and wore the emblem of equestrian rank, a gold ring, given him by Sulla. The Roman populace and nobles he moved with equal facility to tears or laughter by his irresistible histrionic power, for while he was a tragedian unparalleled in the history of the ancient Roman stage, he was also a comedian of fresh and natural humor. Cicero

did not disdain to receive instructions from the great actor, whom the first orator of Rome always spoke of in terms of affection and admiration.

ROSCOE, rōs'kō, **SIR Henry Enfield**, English chemist: b. London, 7 Jan. 1833; d. 18 Dec. 1915. He was educated at University College, London, and at Heidelberg, making a special study of chemistry. He occupied the chair of chemistry at Owens College, Manchester, in 1857-87. He was knighted in 1884, sat in Parliament for South Manchester in 1885-95, and in 1896-1902 was vice-chancellor of the University of London. He received high honors from the universities and learned societies of England and published 'Investigations on the Chemical Action of Light'; 'Lessons in Elementary Chemistry' (1871); 'A Treatise on Chemistry' (1878-89); 'The Hydrocarbons and Their Derivatives,' with Schorlemmer (1881-92), etc. His 'Life and Experiences' were published in 1906.

ROSCOE, **William**, English biographer: b. near Liverpool, 8 March 1753; d. Toxteth Park, Liverpool, 30 June 1831. At 16 he was articled to an attorney in Liverpool, and this obliging him to study Latin, he read and made himself master of the Latin classics. He next studied the Italian and French languages, and in the former became uncommonly proficient. Having finished his clerkship, he was taken into partnership by an attorney of considerable practice and carried on the whole of his business. In 1777 he published a collection of some of his earlier poems and when the question of the slave-trade came uppermost Roscoe took a warm part in favor of its abolition and joined Clarkson in his endeavors to that end. His 'Scriptural Refutation of a Pamphlet on the Licitness of the Slave-Trade' and his 'Wrongs of Africa' appeared in 1788; and in 1796 he brought out the work which gained him celebrity, the 'Life of Lorenzo de' Medici, called the Magnificent' (1795), since translated into Italian, French and German. He published the 'Life and Pontificate of Leo X' in 1805, and in 1806-07 represented Liverpool in Parliament. He had previously entered into business at Liverpool as a banker, a move which eventually landed him in great pecuniary difficulties. He was the author of several political pamphlets and the mover and supporter of several public works in Liverpool. To the botanic garden and to the Athenæum he lent much effective assistance. Consult his 'Life and Correspondence' (1833) by his son, Henry Roscoe.

ROSCOEITE, a vanadium-bearing mica (muscovite) in which part of the Al_2O_3 is replaced by V_2O_5 , the latter reaching 28.85 per cent in some specimens. It occurs in thin layers with gold near Coloma, Cal., and at various localities in central and western Colorado.

ROSE, rōz, **Chauncey**, American philanthropist: b. Wethersfield, Conn., 24 Dec. 1794; d. Terre Haute, Ind., 13 Aug. 1877. In 1825 he settled in Terre Haute as a merchant, where by his investments in land he became wealthy. He was an active promoter of railroad interests and was especially interested in the Terre Haute and Indianapolis Railroad. Though legally entitled to the fortune of his brother John, he disposed of almost the entire amount of

\$1,600,000 in benevolent enterprises which he knew his brother to have favored, and later founded from his own fortune the Rose Polytechnic Institute to which he left the greater share of his estate.

ROSE, **George** ("ARTHUR SKETCHLEY"), English dramatist and novelist: b. London, England, 19 May 1817; d. there, 11 Nov. 1882. He was graduated at Oxford in 1845, took orders in the Church of England in 1848 and after holding several curacies became in 1855 a Roman Catholic. He then engaged in tutoring and later devoted himself to a literary career in which he achieved a considerable success. His 'Mrs. Brown' monologues were published in 32 volumes (1866-70) and enjoyed wide popularity. His other works include novels, 'A Match in the Dark' (1878); and 'A Marriage of Conscience' (1879); plays, 'The Dark Cloud' (1863); 'How Will They Get Out of It?' (1864); 'Money Makes the Man' (1870); and also several works of travel, 'The Great Country, or Impressions of America' (1868); 'Out for a Holiday' (1870), etc. Consult Winter's 'Old Friends' (1909).

ROSE, rōz'é, **Gustav**, German mineralogist, brother of Heinrich Rose (q.v.): b. Berlin, 28 March 1798; d. there, 15 July 1873. He studied under Berzelius at Stockholm, in 1822 became keeper of the mineralogical collection in the University of Berlin, and in 1826 was made extraordinary and in 1839 ordinary professor of mineralogy in that institution. Beside several essays in Poggendorff's 'Annalen,' he wrote 'Elemente der Krystallographie' (1833); 'Ueber das Krystallisationsystem des Quarzes' (1846); 'Das Krystallochemische Mineralsystem' (1852). With Humboldt and Ehrenberg he made in 1829 a journey to northern Asia, an account of which he gave in a work entitled 'Reise nach dem Ural dem Altai und dem Kaspische Meere' (1837-42).

ROSE, **Heinrich**, German chemist: b. Berlin, 6 Aug. 1795; d. there, 27 Jan. 1864. He first devoted himself to pharmacy, studied in Berlin, in Stockholm in 1819 under Berzelius, and from there went to Kiel, where he took his degree. In 1823 he became extraordinary and in 1835 ordinary professor of chemistry at Berlin. As a practical analyst in the department of inorganic chemistry he held a high rank, and the result of his labors can be found in his memoirs inserted in the 'Annalen' of Poggendorff. His 'Manual of Analytical Chemistry' (1829) was translated into French, English and Swedish. In 1844 he discovered a new metal in the tantalites of Bavaria which he called niobium.

ROSE, **Hugh Henry**, **LORD BARON STRATHNAIRN**, English soldier and diplomatist: b. Berlin, 6 April 1801; d. Paris, 16 Oct. 1885. He entered the British army in 1820, was military attaché to the Turkish army in 1840, was consul-general for Syria 1841-48, as secretary to Lord Stratford de Radcliffe was chargé-d'affaires at Constantinople in 1852-54 and was commissioner at the French headquarters during the Crimean War and served at the Alma and Inkerman. He was sent to India in 1857 to command the Central Indian army and virtually reconquered Central India. Though his campaign was overshadowed by that of Sir Colin Campbell, it is generally admitted that his operations were

more skilful and brilliant than his chief's, on whose death he became commander-in-chief in India. He held the same post in Ireland 1865-70, was raised to the peerage in 1866 and made field-marshal in 1877. Consult Burne, Sir O. T., 'Clyde and Strathnairn' (1891).

ROSE, Hugh James, English theologian: b. Little Horsted, Sussex, 1795; d. Florence, 22 Dec. 1838. He was graduated at Trinity College, Cambridge, in 1817; was professor of divinity at the University of Durham in 1833; and in 1836 principal of King's College, London. He was one of the leaders of the Oxford movement, and it was at his rectory, Hadleigh, Suffolk, in July 1833, that a resolution was made to publish 'Tracts for the Time.' "He was," says Dean Church, "the most accomplished divine and teacher in the English Church. He was really a learned man. He had the intellect and energy and literary skill to use his learning. He was a man of singularly elevated and religious character; he had something of the eye and temper of a statesman, and he was profoundly loyal to the Church." It is not too much to say that by his early death the Tractarian movement lost its balance wheel. (See OXFORD MOVEMENT). Consult Church, 'The Oxford Movement' (1891); Mozley, 'Reminiscences.'

ROSE, Sir John, Canadian financier: b. Turrieff, Aberdeenshire, 2 Aug. 1820; d. Caithness-shire, 24 Aug. 1888. He was educated at King's College, Aberdeen, and in 1836 removed with his parents to Canada. He served as a volunteer during the rebellion of 1837. In 1842 he was admitted to the bar and soon established a large practice at Montreal. He entered Parliament as member for Montreal in 1857, and after the Union until his retirement in 1869 represented Huntingdon. He was solicitor-general for Lower Canada in 1857, minister of public works in 1859 and in 1864 was appointed commissioner for the settlement of claims under the Oregon treaty with the United States. In 1867-69 he was minister of finance, then retired from office, went to England and engaged in banking. He represented the English government on a confidential mission to the United States which led to the Treaty of Washington in 1870, and until his death was regarded as the unofficial representative of Canadian interests in England. He was created a baronet in 1872 and in 1886 was made an imperial privy-councillor.

ROSE, John Holland, English historian: b. Bedford, 1855. He was graduated at Cambridge University, received a fellowship at Christ's College and since 1911 has been reader in modern history at Cambridge. Besides much editorial work and contributions to the 'Cambridge Modern History' he is author of 'The Revolutionary and Napoleonic Era' (1897); 'Life of Napoleon' (1902); 'William Pitt and the Great War' (1915); 'Nationality a Factor in Modern History' (1916); 'Why We Carry On' (1918), etc.

ROSE, Joseph Nelson, American botanist: b. near Liberty, Ind., 11 Jan. 1862. He was educated at Wabash College and was assistant in botany there in 1888-89. He was first assistant in the division of botany of the United States Department of Agriculture in 1888-94;

assistant and later associate curator of the United States National Museum in 1894-1912, and since then associate in botany there. He is also research associate of Carnegie Institute, Washington. He has made an exhaustive study of cacti. He was joint editor of 'Revision of the Umbelliferae of the United States' (1888); and of 'Revision of North American Crassulaceae' (1905). Besides numerous articles in technical journals on Umbelliferae, Cacticeae and Mexican plants, he is author of 'Useful Plants of Mexico' (1899); 'Monograph of North American Umbelliferae' (1901).

ROSE. See ROSACEAE; ROSES.

ROSE, Attar of. See ATTAR OF ROSES.

ROSE IN ART AND SYMBOLISM. The Bible but twice mentions the rose, and modern criticism tends to prove that in both cases it is a mistranslation and refers to some other growth. In the Song of Solomon the "rose of Sharon" is mentioned. In historical reference we find the rose mentioned as of religious significance already in the ancient Zendavesta, and it was held in reverence by ancient Indians, Syrians and Egyptians. But the rose does not appear as a motif in Egyptian art, though the Babylonians had their staves ornamented with silver roses as tokens of festivity. In the heathen mythology the rose was dedicated to Aphrodite and was claimed either to have been created from the blood of Adonis or to have been caused by the sea-foam dropping from the newly-created Aphrodite bursting into bloom. In mythological evolution the rose became a symbol of Eros, later of the Muses and of the Graces. Dionysus (Bacchus) also had a rose as attribute, hence this flower decorated the guests at banquets. In this context it may be mentioned that the rose has always been the queen of wreath-flowers and ornamental expression of beauty. In antithesis the rose was a symbol of decay; hence an emblem of death. Originating in the Orient the rose became a popular growth with the Greeks, who in turn carried its cultivation into their colonies in Italy and elsewhere. The *ephebes* in their youthful capacity as servers of wine to the guests wore roses on their heads as did also the female dancers. In the orgies following the banquet roses were used in great abundance, smothering the tables, and the Latin term *sub rosa* is said to have originated from the rule that all acts after the arrival of the flowered decoration were considered secret with the convivialists. Nero is said to have squandered \$150,000 in roses at a single feast; the sybarites are said to have reposed on a bed of roses. In Christian iconography we find the rose and blood of Christ brought into close symbolic correlation and in the Catacombs the rose and wreath of roses are pictured as symbols of martyrdom. In ecclesiastical art we early find the Holy Virgin symbolized by the rose (*rosa mystica*) and one of her titles became in Italy Santa Maria della Rosa. The flower is often found in her hand in early paintings. Another one of the Virgin's titles is *Rosa Caeli*, the Rose of Heaven. Ever since the Middle Ages the Pope has, on Lætare Sunday, blessed a golden rose which he bestows to some beneficiary. Some Italian writers have declared that the term *sub rosa* is derived from the fact of

the Pope presenting (since 1526) consecrated roses which were placed over the confessionals at Rome to denote secrecy, the rose being a symbol of silence. In legend, Saint Dorothea, who suffered martyrdom under Fabricius, made a convert of Theophilus by sending him some roses from Paradise. The rose is an attribute of the saints: Casilda, Elizabeth of Portugal, Rose of Lima, Rose of Viterbo, Rosalia and others.

In heraldry the rose is blazon of the *difference* or *brisure* of the seventh son. The heraldic rose is depicted without leaves or stem and has five petals but the *rose double* displays five other petals within the outer ones; it is pictured full blown. The badge of the House of York is a white rose, while that of the House of Lancaster, its former rival, was a red rose, and their numerous feudal combats are known in history as the "Wars of the Roses." The "Tudor" rose is the white rose of York and red rose of Lancaster combined. In old England roses were the popular presents for birthdays, but in classic art a rose figured on a tomb denotes a short life. And with the Romans the graves were strewn with roses, emblematic of death.

CLEMENT W. COUMBE.

ROSE-CHAFER. See GRAPE INSECT-PESTS.

ROSE FESTIVAL, a peculiar kind of festival which is celebrated annually on 8 June in some French villages. A similar gala-day is celebrated in Los Angeles, Cal., annually in June.

ROSE OF JERICHO, or RESURRECTION PLANT, a small, annual, cruciferous plant (*Anastatica hierochuntica*) which grows in the desert regions about the Red Sea. It bears minute white flowers succeeded by tiny pods, containing a few seeds. When the seeds are ripe the leaves fall off, the branches curl inward and interlace, enclosing the pods still holding their seeds, and become dry and rigid, causing the plant to assume the form of a ball, ready to be blown hither and thither by the winds of the dry season. When the plant is deposited in a damp place, it exercises its remarkable hygroscopic powers, rapidly uncoils and lets the seed escape in soil suitable for germination. This habit of curling up when dry, and rapid absorption of water, forcing the apparently dead limbs to spread open, as if alive again, has caused the plant to be collected and sold as a curiosity.

ROSE OF LIMA, Saint, a religious woman of Spanish America: b. Lima, Peru, 20 April 1586; d. there, 30 Aug. 1617. Her baptismal name was Isabel, but from her fine complexion she was given the name of Rose. She early showed herself resolute in avoiding the self-indulgence of society and the world. As a symbol of the life she had chosen she planted her garden only with bitter herbs and interspersed them with figures of the cross. In her religious exercises she took the great mystic, Catharine of Siena, as her model. When her parents fell into poverty she was taken into the family of the treasurer Gonsalvo, by the devout wife

of that gentleman, and by her labor day and night supplied the necessities of her parents. When she was importuned by her friends to marry, she refused, and as her duty to her parents forbade her taking the veil, she emphasized her refusal by joining the Third Order of Saint Dominick, and the religious strictness and exalted piety of her life was an example which won the admiration, sometimes the imitation, of the worldly and profane. On her death the chapter of the cathedral, the senate and all the most honorable companies of the city took turns in carrying her body to the grave. She was canonized by Clement X in 1671, and 30 August was appointed for her festival.

ROSE OF LIPPE, The. See ORDERS, ROYAL.

ROSE-MALLOW. See HIBISCUS.

ROSE-NOBLE, an English gold coin current in the 15th and 16th centuries, and of varying value. It was so called because it was of the same value as the noble, a money of account, and was stamped on one side with the figure of a rose. It ceased to be coined in the reign of Henry V.

ROSE POLYTECHNIC INSTITUTE, an institution of collegiate grade at Terre Haute, Ind. Its organization was begun as early as 1874, but it was not opened to students until 1883. It is governed by a board of nine members, of whom one is an alumnus elected by the alumni. The institute offers four courses, each of four years' duration. They are in mechanical engineering, electrical engineering, civil engineering and architecture, and chemistry. From the first the practical work in the institute shops has been an important feature of the curriculum. The degree of bachelor of science is conferred for the completion of any of these courses; that of master of science, two years after graduation if one year is spent in graduate study; the degrees of mechanical engineer, electrical engineer or civil engineer are conferred upon those who have the master's degree after two years' successful professional work. The grounds and buildings of the institute are valued at \$145,000; the library contains 16,000 volumes. The original endowment from the founder, Chauncey Rose, was over \$500,000, and additions to this fund have since been made. The students in 1917 numbered 210, and the faculty 20.

ROSE OF SHARON, a name given to an ornamental malvaceous shrub, the *Hibiscus syriacus*. The rose of Sharon of the Bible was doubtless a bulbous plant, probably a kind of narcissus. See HIBISCUS.

ROSE WINDOW, a circular window, especially one divided into compartments by mullions and tracery radiating from the centre, also called Catharine wheel and marigold window according to modifications of the design. It forms a fine feature in the church architecture of the 13th and 14th centuries, and is mostly employed in the triangular spaces of gables. In France it is much used, and, notwithstanding difficulties of construction, attained great size. Notable examples are found in the windows in the cathedrals of Amiens, Chartres, Paris, and in that of Rheims Cathe-

dral which was over 40 feet in diameter. See ECCLESIASTICAL ART.

ROSE-WOOD, the commercial name for chestnut-colored, dark-veined woods, brought chiefly from Brazil, of varying origin, but mainly the product of *Dalbergia nigra*, one of the *Luguminosae* or *Fabaceae*. It is imported not in logs or planks, since the large heart-wood rots easily, but in segments, and is sold by weight, being valued according to its richness of color. When cut it gives out a faint rose-odor, and is fine and hard, takes a high polish and is much in demand for cabinet making and pianos, being used solidly and in veneer, although somewhat difficult to work on account of its resinous veinings.

ROSEATE SPOONBILL. See SPOONBILL.

ROSEATE TERN. See TERN.

ROSEBERRY, rōz'bēr-i, Archibald Philip Primrose, 5TH EARL OF, English statesman and author: b. London, 7 May 1847. He was educated at Eton and Oxford; became Earl of Rosebery in 1868; as a member of the House of Lords entered his political career without the advantage of a training in the Commons, but soon proved himself a brilliant debater; in 1872 was a commissioner on Scottish endowments, and was successively rector of the great Scottish universities of Aberdeen (1878-81) and Edinburgh (1882-83). In 1878 he married Hannah, only daughter of Baron Meyer de Rothschild. From August 1881 to June 1883 he was Under-Secretary of State for the Home Department, in 1884 became First Commissioner of Works and in 1886 was appointed Secretary of State for Foreign Affairs in Gladstone's Home Rule government. He was generally approved for his skilful treatment of the difficult questions connected with the war between Bulgaria and Serbia and the coercion by the European concert of Greece, then threatening war with Turkey. With the defeat of the Home Rule bill and of the government at the general election he passed from office. He soon, however, entered upon a new activity and one with which up to his time peers had been supposed to have nothing to do, namely, the municipal government of London. Upon the organization of the London County Council, a representative body chosen by popular suffrage and responsible to the public, he at once enlisted himself in the service of the improved system of government promised thereby, on 17 Jan. 1888 became a member of the council and on 12 February was made its chairman. In June 1890 he resigned. Following his example many others of rank and prominence entered the council, whose work was raised to an important position in English public life. For some months in 1892 he was again president of the council. Upon Gladstone's accession to power in that year he once more became Secretary for Foreign Affairs. He maintained continuity in foreign policy; strongly advocated some kind of imperial federation; made in September 1894 a notable and characteristic speech before the Lords on the Home Rule bill, which, though passed by the Commons, was thrown out by the Upper House after a four-days' discussion; and brought to a satisfactory end the serious coal strike of 1893. When Gladstone retired from political

life in 1894 Rosebery was summoned to form an administration, notwithstanding that there were other Liberals whose length of service was thought by many to give them precedence. Many influential Liberals objected, too, it was said, to a Prime Minister without the House of Commons. No remarkable events attended his administration. The Liberal majority was not large; and before long there were evidences of an increasing division within the party, due in large measure to opposition to his imperialistic views. His government was once or twice discomfited, and finally on 21 Jan. 1895 was defeated in the committee on army estimates. He resigned on 22 January and became the leader of the Liberal opposition. In October 1896 he resigned this position, and since that time has continued, to use his own phrase, to "plough his lonely furrow." In May 1898 he spoke on Gladstone before the House of Lords; in 1899 was elected lord rector and in 1908 chancellor of Glasgow University. In his later years he advocated the elimination of Home Rule from the Liberal program, and opposed Chamberlain's tariff reform scheme. He is distinguished for his many and varied attainments, and as a ceremonial and commemorative orator is unequalled in England. Marked characteristics of his speeches are their literary quality, derived from a very extensive reading, and that skilful irony whose presence he has so admirably indicated in the writings of Stevenson. As an author he is known for his 'Life of William Pitt' (1891), already becoming a sort of classic; a 'Life of Sir Robert Peel' (1899), and 'Napoleon: The Last Phase' (1900), a most careful and interesting narrative of the captivity at Saint Helena, with a severe arraignment of English blunders in the treatment of the emperor; 'Lord Randolph Churchill' (1906), and 'Chatham: His Early Life and Connections' (1910). Consult the 'Life and Speeches' (1900) by Coates, a eulogy throughout; also the collection, 'Appreciations and Addresses' (1899). See GREAT BRITAIN—HISTORY OF THE 19TH CENTURY.

ROSEBRUGH, rōz'brū, Abner Mulholland, Canadian physician and inventor: b. near Galt, Ontario, 8 Nov. 1835; d. 1914. He was educated at Victoria College, Toronto, and later studied in New York and London. He engaged in practice at Toronto, revived the Free Dispensary there in 1863, and in 1867 organized the Toronto Eye and Ear Infirmary. He specialized in medical electricity and in ophthalmology. In 1864 he invented a new demonstrating ophthalmoscope, and in 1865 he succeeded in photographing the inverted retinal image of an object placed in front of the eye. He perfected in 1883 a practical method of duplex transmission of telegraphic and telephonic communication, and improved the method in 1890. Author of 'An Introduction to the Study of the Optical Defects of the Eye' (1866); 'Chloroform and a New Way of Administering It' (1869); 'Handbook of Medical Electricity' (1885), etc.

ROSEBURG, rōz'bērg, Ore., city, county-seat of Douglas County, on the Umpqua River, and on the Southern Pacific Railroad, about 200 miles south of Portland. It is the commercial and trade centre for the fertile valley of the Umpqua, in which farming, fruit-growing, stock-raising and mining are carried on.

The chief manufactures are flour, dairy products, canned fruits, wagons and carriages. It has the Oregon State Soldiers' Home. Pop. 4,738.

ROSECRANS, rō'zē-krānz, William Starke, American soldier: b. Kingston, Ohio, 6 Sept. 1819; d. near Redondo, Cal., 11 March 1898. He was graduated at West Point, entering the army as 2d lieutenant of engineers in 1842, but in 1844 returned to West Point as assistant professor of engineering. From 1847 to 1854 he superintended the repair of various harbors on the eastern coast, but resigned his commission in the last-named year and retired to private life in Cincinnati, where he became a consulting engineer and architect. He entered upon his career in the Civil War in the volunteer army, his first service being the organization of the Ohio troops. From colonel of the 23d Ohio Volunteers he was promoted brigadier-general, United States Volunteers, in May 1861, and 23 June was placed in command of three brigades under McClellan in the campaign of western Virginia, where he was victor in the battles of Rich Mountain and Carnifax Ferry. He served in the Department of Western Virginia until he succeeded General Pope in command of the Army of the Mississippi. After successfully defending Corinth in western Tennessee during the siege of 11 June 1862, he was put in command of that district by General Grant, with headquarters at Jackson, Tenn. His memorable career as commander of the Army of the Cumberland began in October 1862, and in June 1863 he moved upon the Confederate army under General Bragg, whose forces he had been holding in intrenchment during the Northern victory at Vicksburg, causing Bragg's retreat over the Cumberland Mountains to Chattanooga. In the battle of Chickamauga, 19-20 Sept. 1863, Rosecrans was badly defeated. He was soon after transferred to the Department of the Missouri, and in 1864 relieved of his command. He retired to Cincinnati, where he remained until 1868, when he was appointed Minister to Mexico. In 1865 he was brevetted major-general in the United States army. In 1881-85 he represented California in Congress. From 1885 to 1893 he was Register of the United States Treasury and his beautiful signature is to be seen on the treasury notes of that period. He was restored to the rank of brigadier-general and placed on the retired list of army officers in 1898. Consult Bickhork, 'Rosecrans' Campaign with 14th Army Corps' (1863); Cast, 'The Army of the Cumberland' (1875); Fiske, 'The Mississippi Valley in the Civil War' (1900).

ROSEDALE, Kan., city in Wyandotte County, near Kansas River, adjoining Kansas City, Kan., on the north and Kansas City, Mo., on the east, and on the Saint Louis and San Francisco Railroad. The city virtually forms a part of Kansas City. There are iron and wire works. Pop. 5,960.

ROSEFISH, a large red fish (*Sebastes marinus*) of the rockfish family (*Scorpenidae*), taken numerous on far northern coasts, where it frequents shallow shore-waters, while southward it remains at considerable depths. It bites readily to hand or trawl lines, its flesh is good, and it is profitable for market as it reaches a length of two feet. Its color is orange-red.

Many local names belong to it, as red perch, snapper, Norway haddock, hemdurgan, etc. The rosefish feeds upon crustaceans, small fish and mollusks; and the young at least are among the most important food-resources of cod and halibut.

ROSEGER, Peter, Austrian novelist and short-story writer: b. Alpl, Styria, 31 July 1843; d. 28 June 1918. The son of a poor peasant, he was obliged to obtain an education by his own efforts, chiefly out of school, until he gained the literary protection of Albert Swo-boda, editor of the *Graz Tagespost*, to which Rosegger became a contributor. He obtained a traveling stipend, with the aid of which he visited Germany, Holland, Switzerland and Italy, and in 1876 founded, at Graz, the *Heimgarten*, a periodical with which he continued to be connected until his death. His stories deal with the life of the mountain peasantry of Styria and possess a great deal of rude energy and simple pathos and humor, not always without sentimentality. The most famous is 'Die Schriften des Waldschulmeisters,' purporting to be the autobiographical record of a recluse country schoolmaster, Andreas Erdmann, who chooses this profession after an adventurous youth, but, after having practised it for 50 years, again feels a longing for the more exciting life of great multitudes. Other important works are 'Das Buch der Novellen' (1872-86); 'Waldheimat' (autobiographical, 1873, 1877; 35th ed., 1912); 'Der Gottsucher' (1883); 'Jakob der Letzte' (1888); 'Peter Mayr' (1893). Two good editions of his works are 'Ausgewählte Schriften' (30 vols., Vienna 1894) and 'Voll-sausgabe' or People's edition (40 vols., Vienna and Leipzig 1895-1900). There are biographies by Vulliod (in French) and by Feierfeil (in German).

ROSELLE, N. J., borough in Union County, three miles southwest of Elizabeth, on the Central of New Jersey and the Lehigh Valley railroads. It has iron works and manufactories of hydraulic machinery. Pop. 2,765. It is adjoined on the west by Roselle Park, a separate borough of residential character. Pop. 3,138.

ROSELLINI, rōz'el-lē'nē, Ippolito, Italian Egyptologist: b. Pisa, 13 Aug. 1800; d. 4 June 1843. He was educated at Bologna under Mezzofanti, and in 1824 was called to the chair of Oriental languages at the University of Pisa. He shortly afterward became interested in Egyptology, and was associated with J. F. Campollion in study as well as in explorations in Egypt in 1828-29. The death of Campollion left to Rosellini the task of publishing the results of their explorations 'Monumenti dell' Egitto e della Nubia' (10 vols., Florence 1832-40). He was also author of 'Elementa Linguae Aegyptiacae' (1837).

ROSEMARY, a shrubby, strongly aromatic plant (*Rosmarinus officinalis*), growing wild in the southern parts of Europe and also cultivated. It belongs to the Mint family (*Men-thaceae*) and has axillary, pale blue flowers with two stamens. The stem is three or four feet high, bearing opposite, linear sessile leaves with revolute margins, which are dark-green, smooth, and shining above, white and cottony beneath. Rosemary is tonic and slightly stimulant, and

formerly enjoyed considerable repute as a medicine. It yields, by distillation, a light pale essential oil of great fragrance, which is used in hair pomades. The herb is also used for seasoning in Italy. Rosemary is often referred to in folk-lore: it was supposed to restore youth when eaten; it was woven into brides' wreaths, and otherwise employed at weddings, and was carried to funerals and thrown on the graves, because, as it did not soon fade, it was a symbol of remembrance. "There's rosemary, that's for remembrance."

ROSEN, Charles, American artist: b. Westmoreland County, Pa., 28 April 1878. He studied at the National Academy of Design and at the New York School of Art, and has specialized in landscape painting. He received the Hallgarten Prize for his 'Rocky Ledge' (1912); was awarded the silver medal at the San Francisco Exposition in 1915; and the Inness gold medal and Altman first prize in 1916. He became an associate of the National Academy in 1913, and member in 1917. His work is represented in the permanent collection of Delgado Museum, New Orleans; and by 'Washed out Bottom Lands' (Minneapolis Society of Fine Arts); 'Late Sunlight' (Duluth Art Association).

ROSEN, Friedrich August, German Sanskrit scholar: b. Hanover, 2 Sept. 1805; d. London, England, 12 Sept. 1837. He studied at Göttingen and Leipzig, and under Bopp at Berlin, and Silvestre de Sacy at Paris. He occupied the chair of Oriental languages at the University of London in 1828-30, then resigning in order to devote himself to the study of Sanskrit, although he returned to the University as professor of Sanskrit shortly before his death. Overstudy and overwork in earning a subsistence shortened his life. He was author of 'Corporis radicum Sanscritarum prolusio' (1826); 'Radices Sanscritæ' (1827); 'Rig-Veda Specimen' (1830); 'Algebra of Mohammed ben Musa' (1831). He edited Haughton's 'Bengali and Sanskrit Dictionary'; Colebrooke, H. T., 'Miscellaneous Essays,' etc. He was engaged in preparing a text and Latin translation of 'Rig-veda' at the time of his death. The first volume was published posthumously as 'Rigveda Sanhita, Liber-Primus Sanscritæ et Latine' (Oriental Translation Fund, 1838).

ROSEN, Roman Romanovitch, BARON, Russian diplomat: b. 1849. He was educated at the University of Dorpat, and at the Imperial Academy of Law at Saint Petersburg; received an appointment in the Department of Justice and was soon transferred to the Department of Foreign Affairs. He was vice-consul at Yokohama, and later secretary of the Legation at Tokio; and became Russian consul-general at San Francisco. He was chargé d'affaires at Washington during the period in 1886-89 when there was no Russian Ambassador at Washington. Subsequently he was Minister to Mexico, Serbia, Bavaria and Greece; and at the outbreak of the Russo-Japanese War he was Minister to Japan. He was one of the Russian plenipotentiaries at Portsmouth during the Peace Conference; and in 1905-11 he was Ambassador to the United States. He revisited the United States in 1919.

ROSENAU, rô'zē-now, Milton Joseph, American physician and sanitarian: b. Philadelphia, Pa., 1 Jan. 1869. He was graduated M.D. at the University of Pennsylvania in 1889, and later studied at Berlin, Vienna and Paris. He was surgeon of the United States Public Health and Marine Hospital Service in 1890-1909. Since 1909 he has been professor of preventive medicine and hygiene at the Harvard Medical School; and also director of the School for Health Officers of Harvard University and the Massachusetts Institute of Technology since 1913, and director of the Anti-toxin and Vaccine Laboratory since 1914. He was appointed surgeon with rank of lieutenant commander in the United States Naval Reserve Force in 1917. He was awarded the Georgetown University gold medal of American medicine for service to humanity in 1913-14. Author of 'Viability of the Bacillus Pests' (1901); 'Course in Pathology and Bacteriology' (1902); 'The Immunity Unit for Diphtheria Anti-toxin' (1905); 'The Standardization of Tetanus Anti-toxin' (1908); 'Preventive Medicine and Hygiene' (1913; 3d ed., 1917), etc.

ROSENAU, William, American rabbi and educator: b. Wollstein, Germany. After coming to America he studied in the public schools of Philadelphia and Cincinnati and was graduated from the Hebrew Union College in Cincinnati in 1889. He was rabbi in Omaha, Neb., 1889-92, and has been rabbi in Baltimore since 1892. He has been instructor and is now associate in rabbinica at Johns Hopkins University, and among his publications are 'Semitic Studies in American Colleges'; 'Hebraism in the Authorized Version of the Bible'; 'Jewish Ceremonial Institutions and Customs.'

ROSENDALE, rô'zēn-dāl, N. Y., village in Ulster County, on the Rondout River, the Delaware and Hudson Canal, and the Walkill Valley Railroad, about eight miles south by west of Kingston (q.v.). It is noted for its manufacture of hydraulic cement (q.v.). Most of the cement derived from the natural cement rock in the United States comes from Rosendale. Pop. 1,125.

ROSENTHAL, rô'zēn-tāl, Max, American artist: b. Turck, then in Russian Poland, 23 Nov. 1833; d. August 1918. At 14 he studied art in Paris, and coming to Philadelphia in 1849, he entered the Academy of Fine Arts, chromo-lithography being his specialty. In 1861 he followed the Army of the Potomac and executed drawings of every camp until Gettysburg. Some of his best work is seen in illustrated plates of the report of the United States Military Commission to the Crimea (1860) and in Dickinson's 'Numismatics of the United States.' In 1880 he started etching and made all of the Continental Congress, officers that fought in the American Revolution, the British officers, Attorneys-General and in 1891 illustrated the 'History of the Supreme Court of the United States,' by Hampton L. Carson, also began Mezzotinting in 1891. In 1906 he painted a large picture of 'Jesus at Prayer' and at the same time made quite a few miniatures. More than 500 of his historic portraits are in the Smithsonian Institution.

ROSENTHAL, Toby Edward, American painter: b. New Haven, Conn., 15 March 1848;

reported deceased c. 28 Dec. 1917. He studied at Munich in the studio of K. Raupp (q.v.) and in 1868 came under the instruction of Piloty. After producing many genre pictures he attracted attention by his 'Sebastian Bach and his Family at their Morning Devotions' (1870), which was purchased by the Leipzig Museum. After a visit to his home in the United States he returned to Munich and painted 'Elaine the Fair' (1874) from Tennyson's idyll of 'Elaine.' He also produced some humorous pictures, such as 'He Laughs Best Who Laughs Last' (two panels) and 'The Girls' Boarding School in Alarm' (1877). His name will be perhaps best remembered for his 'Trial of the Escaped Nun, Constance de Beverley' (from Sir Walter Scott's 'Marmion'), and 'A Dancing Lesson of Our Grandmothers.' Two other paintings of this artist have become universally popular; these are 'The Portrait of the Cardinal' and the dramatic painting 'The Vacant Chair' (both in private galleries in America). Among the more prominent works of his later period are 'The Christ Carver' and 'His Madonna.' Mr. Rosenthal was honored by a number of medals of first and second class and received the cross of the Knights of Saint Michael.

ROSENWALD, Julius, American merchant and philanthropist: b. Springfield, Ill., 12 Aug. 1862. He was of Jewish descent and early engaged in the mercantile business. He was vice-president and treasurer of the Chicago mail-order house, Sears, Roebuck and Company, in 1895-1910, and has since been president of the company. He was appointed to the advisory committee of the Council of National Defense and chairman of the Commission on Supplies in 1916. He is a generous benefactor of educational institutions, particularly the Young Men's Christian Association for colored people, rural schools and the Chicago University. He was also a foremost organizer of the Jewish War Relief.

ROSEOLA, any rose-colored rash occurring usually in a symptomatic character, with some febrile disorder, as measles, scarlet fever, etc., or with gastric disturbances. The term is often applied, though inexactly, to German measles and to mild forms of other diseases attended with a rash of similar appearance to that seen in roseola.

ROSES, flowers of the type-genus *Rosa*, of the order *Rosaceæ*. The species are exceedingly variable; probably no other genus calling forth so wide a range of botanical opinion. Most botanists recognize about 100 species; Bentham and Hooker estimate the number at less than 40, but Gandoger describes more than 4,000 as indigenous to Europe and western Asia. The number of horticultural varieties, crosses and hybrids is probably several times larger than in any other genus; more than 3,000 varieties are listed in French catalogues, and since new ones are added annually the list consists of active members. The roses are widely distributed in the temperate and cold parts of the northern hemisphere extending in the respective continents southward to India, Abyssinia and northern Mexico. They are erect, climbing or trailing shrubs, generally prickly-stemmed; bear alternate, odd-pinnate, though sometimes simple, leaves and generally large,

showy, pink, white, yellow or purple flowers born either singly or in terminal corymbs, followed by generally showy berry-like fruits (hips) which contain several bony akenes. Probably no flower has played so important a rôle in the garden and in literature. It was prized in the cradle days of the Aryan race and is frequently mentioned in the writings prior to our era. China and Japan, however, seem to have been less attracted to it than more western races. In very early times the flowers exhibited their characteristic tendency to double; indeed, it is probably the first flower cultivated in this state, and is now more often thought of in this form perhaps than in its natural single form. The single roses are, however, useful and popular in park planting.

Except for ornamental purposes roses are of small importance; the only uses made of them are the preserving of the fruits of a few species for food and the manufacture of perfumes, especially attar or otto of roses and rose water from the flowers of some other kinds, principally *R. alba* and *R. damascena*, which are extensively grown in southeastern Europe, particularly Bulgaria and adjacent Asia and in southern France, in which last country the leading rose is the Provence, a hybrid variety of *R. centifolia*. The flowers are either put in stills or are macerated. In the distilling process the essential oil is extracted by steam and condensed. In each process there is considerable perfume in the water used and in the maceration process, which is most popular in France, this "rose water" is the product sought rather than the attar which is regarded as a by-product. These perfumes are among the most important of the world, and it is said that the importations of the attar alone into the United States is greater than the importations of any citrus perfume such as lemon oil, oil of bergamot, etc.

Unquestionably the roses are the most important flowers cultivated. They are prized by everyone who cares for flowers at all, and throughout the civilized world are probably grown in more gardens than any other flowers. (How important they are commercially appears by the statistics quoted in the article *FLORICULTURE*). In the United States alone the number of blossoms annually grown for sale has been estimated at 100,000,000, valued at about \$6,000,000. Yet the development of this industry, which now demands the greatest skill of specialists, has sprung from insignificance in 1870; and in 1850 it did not exist.

From the botanist's standpoint the classification of Crépin in his 'Primitiæ Monographiæ Rosarum,' seems to be one of the most satisfactory and is followed by botanists perhaps more frequently than any other; from the gardener's standpoint Barron in the 'Cyclopedia of American Horticulture,' divides the roses into 19 groups with more or less subdivision. Among these the following are probably the most important. *Provence*, perhaps most familiar in America in one of its types, the fragrant globular flowered moss roses; *Damask* and *French*, fragrant-flowered, robust growing, hardy prolific roses; *Ayrshire*, very hardy climbing roses with solitary fragrant white to deep crimson flowers; *Briers*, small perishable-flowered garden roses more useful in shrubberies than for cut flowers; *Multiflora*, with large corymbs of rather short-lived flow-

A LA FRANCE ROSE

ers, and popularly known as ramblers, used largely in wild gardens, though the crimson Rambler and its sub-varieties which belong to the polyantha subdivision are used for porch decoration for which they are admirably adapted; *Evergreen*, the foliage continuing very late in autumn; for example, *R. Wichuriana*, a very popular hardy trailer which grows anywhere; *Hybrid perpetual*, upright growing, though sometimes pendulous, shrubs which bear flowers of all types and colors and embrace the largest number of varieties of any group but so greatly mixed as to preclude separation and definition; *Hybrid teas*, a group of the preceding, the members being the result of crosses with the Chinese tea-scented rose, especially rich in forcing varieties; *China* or *monthly rose*, a perpetual-blooming rose chiefly interesting because of its effect upon other roses by hybridizing through its variety the tea rose; *Musk*, very fragrant light-colored rather tender roses best known in their derivatives, and noisettes, which blossom later, are harder than the type, and will grow in any soil but are little used probably because the blending with the teas seems to have impaired their hardiness; *Polyantha*, perpetual-flowering multiflora climbing varieties bearing small flowers in clusters and especially promising as the parents of a nebulous group of varieties adapted to American requirements; *Perpetual briars*, best known in America by one of its component species *R. rugosa*, a hardy Japanese rose much used in exposed situations for hedges, screens, etc., and useful for hybridizing with many other species.

Rose species are propagated by seeds which are either sown as soon as the hips are ripe or are stratified in sand until spring. If allowed to become dry they may require two years to germinate, but if treated as above they generally sprout the first spring. Many species may be propagated by means of cuttings of nearly mature wood taken during summer and rooted under glass. Others will grow from mature wood cuttings taken in autumn and rooted in the spring like currants and gooseberries. Layering is generally practised with such species as do not root readily from cuttings; for example, *R. hemisphaerica* and *R. eglanteria*. Some species such as the cinnamon rose (*R. cinnamomea*), the Carolina rose (*R. carolina*) and the Damask rose (*R. damascena*), may be propagated by suckers, division or by cuttings of the roots which in the last case should be dug in autumn, stored in sand or sphagnum in a frost-proof cellar until spring when they are planted in nursery rows. Grafting and budding are also practised, but are frequently unsatisfactory where regular intelligent attention cannot be given to the removal of the suckers that generally spring from the stock. For greenhouses and for forcing, cuttings of semi-mature wood are nearly universally used. They may be taken at any time, rooted with bottom heat in sand, and kept in pots until large enough to be transplanted upon the branches.

In general, roses thrive best upon loamy soils, rich in plant food and humus, well drained but moist, in situations sheltered from the wind but where they will receive the sunlight at least half the day. They do not generally succeed upon very loose or sandy soils, but often do upon heavy clays. They are seldom difficult to transplant with ordinary care, are easy to culti-

vate and generally simple to prune. The removal of weak and old wood is the most important pruning detail. But care must be taken especially with climbing varieties to preserve the long sturdy shoots, since they are most prolific of blossoms. Indoor roses cultivated for cut flowers are generally pruned so as to have the flowers borne singly at the ends of long stems sometimes, as in the case of American Beauty, exceeding four feet in length. But this is a special florist's practice and is dependent not only upon the method of pruning but upon the management of the plants otherwise. In the garden the plants may usually be set about 30 inches apart in beds about four feet wide, the plants of one row being preferably opposite the intervals of the other so as to obtain full light and air. Beds of this width need not be tramped on when the flowers are being gathered. Cultivation consists in keeping the surface loose and open at all times by raking, a rather shallow forking being given each spring. In the autumn a liberal mulch of stable manure should be spread upon the beds and the coarser parts removed in the spring before the annual forking. The removal of all dead, failing or puny shoots should precede the cultural operations. Many gardeners give applications of liquid manure just as the flower buds appear and preferably preceding a shower. When well managed a rose bed should be satisfactory for 10 or more years.

A large number of insects feed upon the rose both out of doors and in the greenhouse. Of those which sometimes prove troublesome in the garden the rose beetle or chafer is perhaps the most annoying, since it feeds upon the petals of the opening flowers, thus ruining them. The only remedy which has been satisfactorily applied is hand picking. Plant lice (see APHIDS) and scale insects (q.v.) are often found upon roses, but in the garden are not usually very troublesome. Slugs occasionally skeletonize the leaves by working upon the undersides, and several caterpillars, beetles, etc., also live upon the foliage, usually, however, in insufficient numbers to do damage. In the greenhouse some of the above species may appear, but they are usually debarred by correct methods of management, especially as to ventilation, temperature and humidity. The red spider, not an insect but a mite, is sometimes troublesome where the air is allowed to become too dry. Management will also prevent the so-called plant diseases occasionally found in poorly ventilated houses; indeed, attention to the details mentioned is in many leading houses found more expedient and satisfactory than recourse to the so-called remedies for either insects or maladies.

Crop Expert.

ROSES, Wars of the, the name given to the protracted struggle between the houses of Lancaster and York for possession of the English throne, in the second half of the 15th century. The appellation was derived from the badges adopted by the contending parties, a white rose by York and a red rose by Lancaster. The outbreak of the war was brought about by the growing discontent of the people with the evil fortunes of the war against France and the oppressive taxes necessitated by the heavy military expenditures. The imbecile Henry VI (q.v.) had shown himself quite incapable of the tasks of government and this served to enhance the power of Richard, Duke of York, the representative of the claims of the house which had been driven from the throne in 1399 in the person of Richard II, Henry IV assuming the crown by parliamentary sanction, and being succeeded by Henry V. The Duke of York's strongest opponent was Margaret, wife of Henry VI, a woman of great strength of character and much ability. The first battle of the war was fought in 1455 at Saint Albans and resulted in a victory for the Yorkists, whose head became, for the second time, protector of the realm. War broke out again in 1459 and began auspiciously for the Lancastrians. The Duke of York and the Earl of Warwick and Salisbury were compelled to flee the country. In June 1460 they returned, however, and defeated the Lancastrian forces at Northampton and took Henry VI prisoner. A compromise was effected by which Henry VI was to retain the crown until his death, when it was to pass to the Duke of York. Queen Margaret, however, would not consent to this wrong to her son, and continued the struggle. At Wakefield, 30 Dec. 1460, the Yorkists were defeated and the Duke of York was killed, and soon after the Lancastrians gained a second victory at Saint Albans (17 Feb. 1461). Edward, Earl of March, the Duke of York's eldest son, joining forces with Warwick, succeeded in getting possession of London, which was a fervent supporter of the Yorkist cause, and was elected king, setting out immediately to meet the enemy, on whom he inflicted a bloody defeat at Towton (29 March 1461). Henry VI fled to Scotland and the remnants of Lancastrian resistance were crushed out at Hedgley Moor and Hexham in 1464. A quarrel between Edward IV and the Earl of Warwick led the latter to embrace the Lancastrian cause. Returning from France with a large force in 1470, he compelled Edward to seek refuge in Holland. Henry VI was released from captivity and replaced upon the throne. Edward IV, however, returned to England in the early part of 1471, and on 14 April decisively defeated Warwick at Barnet, the "king-maker" himself falling in the fight. On 4 May a Lancastrian force under Queen Margaret was overthrown at Tewkesbury and the young Prince Edward met his death there, most probably by assassination after the battle. Henry VI died in the Tower a few days later, and Edward IV was securely established on the throne. The last battle in the long conflict was fought in 1485 when Henry of Richmond, repre-

sentative of the Lancastrian claims, overthrew Richard III (q.v.) at Bosworth Field and ascended the throne as Henry VII. By his marriage to Elizabeth, the daughter of Edward IV, he united in himself the claims of the rival houses. (See ENGLAND, *Civil History*). Consult Gairdner, 'Lancaster and York' (1886); Oman, 'History of England from Richard II to the Death of Henry IV' (1906).

ROSETTA, rō-zét'ta (Ar. RESHĪD), Egypt, a city near the mouth of the Rosetta Canal—a branch of the Nile—formerly the medium of communication between Cairo and Alexandria, which gave to Rosetta a commercial importance which it has lost by the opening up of other channels of traffic. Between 1798 and 1807 Rosetta was captured in turn by the French, English and Turks. Pop. 17,000.

ROSETTA STONE, a slab of black basalt of ancient Egypt, now in the British Museum, chiefly noted as having furnished the key for the decipherment of the Egyptian hieroglyphics. The stone was discovered in 1799, during the excavation of Fort Saint Julien, near Rosetta, Egypt, by M. Boussard, an officer of engineers in the French army of occupation. Three years later the stone was brought to England and deposited in the Museum. The stone was erected in 195 A.C. by the priests of Egypt in honor of Ptolemy Epiphanes and in commemoration of his remission of the dues of the sacerdotal body. It bears an inscription duplicated in three languages, in Greek, in hieroglyphics, or sacred, in demotic or common characters, and this fact enabled Dr. Thomas Young in 1818 and later, M. Champollion, in 1822, to decipher it in the three languages and thus furnish a key for the reading of the hieroglyphics (q.v.). The Rosetta Stone is three and one-half feet long, two and one-half feet wide and nearly a foot thick. See ARCHÆOLOGY; HIEROGLYPHICS.

ROSETTA WOOD, an East Indian wood, of unknown origin, reddish orange in color, with darker veinings. The wood is close, hard and very beautiful when first cut, but soon becomes darker by exposure. It is used in fine cabinet work, and is imported in logs.

ROSEVILLE, Cal., city in Placer County, 18 miles northeast of Sacramento, on the Southern Pacific Railroad. It is a growing city with machine shops and yards of the Southern Pacific Railroad, an ice-plant and fruit-packing industry. Pop. 2,608.

ROSEWATER, Andrew, American civil and sanitary engineer: b. Bohemia, 31 Oct. 1848. After a course of study in the common and high schools of Cleveland, Ohio, he became flagman in the engineer corps of the Union Pacific Railroad, engaging in explorations and surveys in 1864 and later in other engineering positions on the same road. He was assistant city engineer of Omaha, Neb., 1868-70 and city engineer, 1870-75. He was in charge of the construction of the Omaha and Northwestern Railroad 1878-80; was resident engineer of the Omaha Water Works Company 1880-81, and from 1881-87 was city engineer. Between 1887 and '91 he was consulting and designing engineer of sewerage for 25 cities. Since 1897 he has been city engineer of Omaha and president of its board of public works.

ROSEWATER, Edward, American journalist: b. Bukovan, Bohemia, 1841; d. Omaha, Neb., 31 Aug. 1906. Coming to America in 1854, he became a telegraph operator and for two years (1861-63) was in the United States military telegraph corps. In 1863 he went to Omaha, Neb., as manager of the Pacific Telegraph. In 1871 he was elected to the Nebraska legislature. In 1871 he founded the *Omaha Bee* and edited it till his death. He was vice-president of the Universal Postal Congress at Washington, 1897, and the original founder of the Omaha Trans-Mississippi Exposition (1898).

ROSEWATER, Victor, American journalist: b. Omaha, Neb., 13 Feb. 1811. He was graduated at Columbia University in 1891 and in 1893 engaged in newspaper work on the *Omaha Bee*, of which he became editor in 1906, and editor and publisher in 1917. He lectured on municipal finance at the University of Nebraska in 1894 and at the University of Wisconsin in 1904. He has been active politically and in 1917 was appointed a member of the committee on labor of the Advisory Commission of the Council of National Defense. Author of 'Special Assessments—A Study in Municipal Finance' (1898).

ROSICRUCIANS, rō-zī-kroō'shī-anz, a real or imaginary secret society, the alleged existence of which became known unexpectedly at the beginning of the 17th century. Early in that century appeared several books concerning the society, which are now generally ascribed to Johann Valentin Andrea, a Lutheran clergyman, and among which is the 'Fama Fraternitatis R.C.' (1614). This work is the story of a certain holy and revered Brother Christian Rosenkreuz, a German noble of the 14th century, who, inspired with the lofty ambition of reforming the world, spent a large portion of his days among the Brahmins, and in Jerusalem, Damascus, Egypt, Morocco, Fez, etc., in the pursuit of wisdom. Returning to Germany, he founded an order, consisting of but few members. They met in a house erected by himself, and called Sancti Spiritus Dominus, where he died at the age of 106. His burial-place was to be kept a secret by all the adepts, but he ordered the words "Post CXX annos patebo" to be inscribed upon one of the doors of the house of the order. To this work was added another, 'Confession of the Society and Brotherhood of the Rosy Cross,' addressed to the learned of Europe. This tract declared that the order had no intention of interfering with the religious or political action of states, but only desired the improvement of mankind by the discovery of the true philosophy. Whether such a society ever existed is still an open question. Many will have us believe that the above treatises were meant by Andrea to satirize in serio-comic style the philosophical follies of the age, having no expectation that they would be regarded otherwise than as fiction. The fraternity had fallen out of public attention for a long time, when in the latter half of the 18th century the interest in their organization was revived, especially by the noted imposter Cagliostro, who gave out that he was a Rosicrucian. Consult Semler, 'History of the Rosicrucians' (1768); Waite, 'Real History of the Rosicrucians' (1887).

ROSIN, or RESIN, the name given to the resin of coniferous trees employed in a solid state for ordinary purposes. It is obtained from turpentine by distillation. In the process the oil of the turpentine comes over and the rosin remains behind. There are several varieties of rosin, varying in color from the palest amber to nearly black, and from translucent to opaque. It differs somewhat according to the turpentine from which it is derived, this being obtained from numerous species of pine and fir. It is used in the manufacture of sealing-wax, varnish, cement, soap, for soldering, etc. Colophony is a name for the common varieties. See NAVAL STORES.

RÖSLER, rez'ler, Augustin, German clergyman and historian: b. Guhrau, Silesia, 6 March 1851. He was educated at Glogau Gymnasium and the universities of Breslau and Freiburg-im-Breisgau, and at Rome. In 1875 he was ordained to the priesthood, in 1876-77 edited *Schlesisches Kirchenblatt* at Breslau, and in the latter year entered the Redemptorist Order. In 1880-82 he was professor of dogmatic theology and church history, and after 1882 of Scripture and Hebrew at the Redemptorist scholasticate, Mantern, Styria. His published works are numerous, including 'Der katholische Dichter Aurelius Prudentius Clemens' (1886); 'Der Fahneneid des christlichen Mannes' (1888); 'Der Stall von Bethlehem' (1890); 'Der Katholizismus seine Aufgabe und seine Aussichten nach Prof. Dr. Albert Ehrhard' (1892); 'Cardinal Johannes Dominici, O.P.' (1893); 'Die Frauenfrage vom Standpunkte der Natur, der Geschichte und der Offenbarung' (1893; 2d ed., 1907); 'Cardinal Johannes Dominici's Erziehungslehre und die übrigen pädagogischen Leistungen Italiens im 15. Jahrhundert.' Der Kartäuser Nicolaus Kempf und seine Schrift: 'Ueber das rechte Ziel und die rechte Ordnung des Unterrichts,' Vol. VII of 'Bibliothek der katholischen Pädagogik' (1894); 'Der Reichtum der katholischen Kirche' (1896); 'Gewissensforschung über die Anklagen des Professor Dr. Ehrhard' (1902); 'Die Uebung der Caritas durch die Frauen und an den Frauen' (1901; 2d ed., 1903); 'Fürs Priesterherz' (1907; 2d ed., 1908); 'Liebfrauenschule' (1910; 4th ed., 1912). Dr Rosler was a collaborator in Herder's 'Kirchenlexikon' (2d ed.) and 'Lexikon der Pädagogik'; Buchberger's 'Kirchliches Handlexikon', and contributor to *Literarische Rundschau*, *Historisch-politische Blätter*, the 'Catholic Encyclopedia,' etc.

ROSLIN, ROSLYN, or ROSSLYN, Scotland, village in Edinburghshire, seven miles south of Edinburgh, in the valley of the North Esk. Roslin Chapel, famous for its beauty and containing the tombs of the earls of Orkney and Roslyn, is located here; it was built in the 15th century. Pop. 1,129.

ROSLYN, N. Y., village in Nassau County, Long Island, on an inlet of Long Island Sound, 18 miles northeast of Brooklyn, and on the Long Island Railroad. It was the home of William Cullen Bryant (q.v.), who, with his wife, is buried there. The village is chiefly residential in character. Pop. 1,200.

ROSLYN, Wash., city in Kittitas County, 70 miles east of Tacoma, on the Northern

Pacific Railroad. It has important commercial interests as the centre of the coal-mining district of the State. Pop. 3,126.

ROSMINI, rōs-mē'nē, Antonio Rosmini-Serbati, Italian philosopher: b. Roveredo in the Italian Tyrol, 25 March 1797; d. Stresa, 1 July 1855. He began the course of studies for the priesthood at Padua in 1817, and was ordained in 1821. He became deeply versed in philosophy, ancient and modern, and revolved in his mind a comprehensive system to serve as a basis for the truths of revelation, while on the practical side he planned an institution for the training of teachers and priests. From 1826 to 1828 he lived mostly in Milan, thought out the rule of his new order, visited Rome, gained the approval of Pius VIII both for special studies and for the institution of his order, and published his 'New Essay on the Origin of Ideas' (1830).

After a few years of labor at Trent he settled in 1837 at Stresa on the west shore of Lago Maggiore and, surrounded by loving and devoted friends, sent volume after volume to the press. His dream in politics, as expressed in his 'Constitution according to Social Justice' (1848), was a confederation of the states of Italy under the Pope as perpetual president. For a brief period he basked in the papal favor, and was promised by Pius X a cardinal's hat; and on the Pope's flight to Gaeta he followed, but now found the pontiff's mind turned against him and never afterward regained his confidence. His 'Constitution' and 'The Five Wounds of Holy Church' were next prohibited by an irregular meeting of the Congregation of the Index called at Naples. But in 1854 the Congregation of the Index, the Pope presiding, declared Rosmini's writings entirely free from censure and enjoined perpetual silence on all his accusers. The 'Institute of the Brethren of Charity' survived its founder, and among the Rosminian Fathers, who are mostly Italians or Englishmen, are to be found at the present day some of the ablest and most devoted sons of the Roman Church. In England it has foundations at Ratcliffe, Loughborough, Cardiff, Wadhurst, Rugby, and established in 1876 its central house at Saint Ethelreda's, Holborn, once the domestic chapel of the palace of the bishops of Ely.

The foundation of Rosmini's philosophy is being considered as the form of the intelligence — an elemental intuition of which is implanted by Nature herself. Intuition gives us ideas, of which we may affirm (1) that they are not nothing; (2) that they are not ourselves; (3) that they have a mode of existence of their own, entirely different from that of real or subsistent things, and independent of the bodily sense. Their two essential characteristics are universality and necessity; for real objects and sensations are always particular, instead of being universal and generic, and every object which involves no contradiction is necessarily possible. These two characteristics involve two others, infinity and eternity; the origin of the ideas comes from God, for man does not receive them from the things themselves. The one indeterminate and wholly universal idea is that of being or existence; we cannot determine the subsistence of an object until we first have the idea of it, therefore perception involves the idea which is further isolated from all the other

elements of the perception by the process of universalization through which it may be realized an indefinite number of times. When the ideas are all fully or perfectly determined, they are called concrete; when they remain to a certain extent indeterminate, they are abstract. Being is incorporeal, independent of space, spiritual, and therefore incorruptible and immortal. It is independent of time; as being in its essence is always being, and as it would be a contradiction in terms for being to cease to be being, it is eternal. But since it was united to the soul in time, it must have existed before it and be independent of it. And thus we reach an Intelligence anterior to human intelligence — an Eternal Mind. This eternal mind is God's, and therefore God exists, and his existence and the immortality of the soul remain the true foundation of morals. Consult Tommaseo, 'Antonio Rosmini' (1855); Lockhart, 'Life of Antonio Rosmini' (1866); Werner, 'Rosmini und seine Schule' (1884); and above all, Davidson, Thomas, 'Philosophical System of Rosmini' (1882).

ROSNY, Joseph Henry, pseudonym of the French novelists, Joseph Henri Honoré BOËX: b. Brussels, 1856; and his brother, Séraphin Justin François BOËX: b. Brussels, 1859. Henry worked alone as a novelist until 1891, and the brothers then collaborated until 1912, since when they have written independently. Their work is of a strong sociological trend, the theme sometimes taking an anarchistic level, and there is an extensive interweaving of scientific information. The characters are drawn with a striking realism and present individual portraits rather than representative types. Henry was influenced by Zola in his earlier work but the brothers in 1887 were among the writers who formally protested against Zola's 'La Terre.' Henry was sole author of 'Nell Horn, membre de l'armée du salut' (1886); 'Le Bilatéral' (1886); 'L'Immolation' (1887); 'Le Termite' (1890); 'Erymah' (1895), etc. Together the brothers wrote 'Daniel Valgraiève' (1891); 'L'Imperieuse Bonte' (1894); 'Le Serment' (1896; dramatized 1897); 'Les Ames Perdues' (1899); 'Therese Degaudy' (1902); 'Sous le fardeau' (1906); 'Le Testament volé' (1909); 'La Mort de la terre' (1912), etc. Later Henry was author of 'La guerre du feu' (1913); 'La force Mystérieuse' (1914); 'Perdus?' (1916); 'L'enigme de Givreuse' (1917), etc. Justin was author of 'Sépulchres blanchis' (1913); 'La Caraface' (1914), etc.

ROSNY, Léon Louis Lucien Prunol de (pseudonyms JOSÉ PEREZ and LEONE D'ALBANO). French Orientalist, ethnographer and translator: b. Loos, 5 Aug. 1837. He was educated at the Elève d'Adrien Jessieu and became professor of Japanese at the Bibliothèque Impériale. He was appointed professor at the École des Langues Orientales in 1868; and became director of the École des Hautes-Études at the Sorbonne in 1886. He became an authority on the Chinese, Japanese and Korean languages and on the antiquities of Central America and Yucatan. He edited the *Revue Orientale et Américaine* in 1859-65 and in 1876-79. Author of a Chinese, Japanese and French Dictionary (1864); 'Grammaire Japonaise' (1865); 'Archives Paléographiques' (1869); 'Anthologie

Japonaise' (1871); *Grammar of the Chinese Language*' (1874); *L'interprétation des anciens textes Mayas*' (1875); *Les Coréens, Aperçu ethnographique et historique*' (1886); *'First Elements of Chinese Grammar*' (1887); *'L'atlantide historique*' (1902); *'L'Amérique pre-Colombienne*' (1904), etc.

ROSS, rós, Alexander, British soldier: b. Scotland, 1742; d. London, 29 Nov. 1827. He entered the British army in 1760, and was made captain in 1775. He served as aide-de-camp to Lord Cornwallis in the war of the American Revolution, and served as his commissioner in arranging for his surrender at Yorktown. He afterward served with Cornwallis in India, and in 1812 attained the rank of general.

ROSS, Alexander, Canadian fur trader and author: b. Mairnshire, Scotland, 9 May 1783; d. Manitoba, 23 Oct. 1856. He emigrated to Upper Canada in 1805 where he was for some years a teacher. In 1810 he joined the fur-trading expedition of John Jacob Astor; was one of the founders of Astoria, and established trading posts in the most isolated regions. He wrote the earliest and most graphic accounts of the Columbia and Oregon country, with the opening up of which he was for years identified. In 1814 he joined the Northwest Company and joined in its merger with the Hudson's Bay Company in 1821. He was later prominent in the Red River Colony, and was sheriff of Assiniboia. Among his works are *'Adventures of the First Settlers on the Oregon and Columbia Rivers'* (1849); *'Fur Hunters of the Far West'* (1855), and *'Red River Settlement: Its Rise, Progress and Present State'* (1856).

ROSS, Alexander Milton, Canadian naturalist: b. Belleville, Ontario, 13 Dec. 1832; d. Detroit, Mich., 27 Oct. 1897. At 13 he came to New York, where he became a compositor on the *Evening Post* and a protégé of William Cullen Bryant. In 1851 he began to study medicine, and during the Civil War was a surgeon in the Union army, but rendered his greatest service to the cause as confidential correspondent to Lincoln in Canada. His subsequent life was chiefly devoted to the study of natural history, in the pursuit of which he has added valuable information concerning the fauna and flora of Canada. He published *'Birds of Canada'* (1872); *'Butterflies and Moths of Canada'* (1873); *'Forest Trees of Canada'* (1874); *'Ferns and Wild Flowers of Canada'* (1877); *'Mammals, Reptiles and Fresh Water Fishes of Canada'* (1878).

ROSS, Edward Alsworth, American sociologist: b. Virden, Ill., 12 Dec. 1866. He was graduated at Coe College, Iowa, in 1886 and later studied at Berlin and at Johns Hopkins. He was professor of sociology at Leland Stanford Jr. University in 1893-1900; at the University of Nebraska in 1901-06; and at the University of Wisconsin from 1906. He was lecturer at Harvard in 1902, and at the University of Chicago in 1896 and in 1905. He has been advisory editor of the *American Journal of Sociology* since 1895. In 1914-15 he was president of the American Sociological Society. Author of *'Honest Dollars'* (1896); *'Social Control'* (1901); *'Foundations of Sociology'* (1908); *'The Changing Chinese'* (1915); *'The*

Old World in the New' (1914); *'South of Panama'* (1915); *'Russia in Upheaval'* (1918), etc.

ROSS, George, American patriot: b. New-castle, Del., 1730; d. Lancaster, Pa., July 1779. On his admission to the bar in 1751 he settled in Lancaster, Pa. As a member of the Pennsylvania assembly 1768-70, he drew up the declaration of rights which was presented by the assembly to the proprietary government. He was a member of the Continental Congress from 1774-77, and as such was one of the signers of the Declaration of Independence. In 1779, three months before his death, he was made judge of the Admiralty Court of Pennsylvania.

ROSS, George, Canadian physician: b. Montreal, 11 March 1842; d. November 1892. He was graduated at the McGill University in 1866, and in that year was appointed apothecary to the Montreal General Hospital. He was professor of hygiene at McGill University in 1871-73; held the chair of clinical medicine in 1872-89, and in 1889-91 was vice-dean and professor of medicine there. He was president of the Medico-Chirurgical Society of Montreal and of the Canadian Medical Association, and governor of the College of Physicians and Surgeons of Quebec. He was co-editor of the *Medical and Surgical Journal* and the *Medical Journal*, both published in Montreal, and wrote extensively on aneurism.

ROSS, Sir George William, Canadian statesman: b. near Nairn, Ontario, 18 Sept. 1841; d. 1914. He was educated at the Toronto Normal School and the Law School of Albert University and after several years of educational work was called to the bar in 1887. He served in the Canadian House of Commons in 1872-83; was Minister of Education for Ontario in 1883-99, and Premier and Treasurer in 1899-1905. From 1907 he was a member of the Canadian senate. He was noted as a public speaker and as a worker for temperance, besides doing much to improve the educational system of Ontario. Author of *'The Universities of Canada'* (1896); *'The School System of Ontario'* (1896); *'The Senate of Canada'* (1914).

ROSS, Sir Hew Dalrymple, British field-marshal: b. Galloway County, Scotland, 5 July 1779; d. London, 10 Dec. 1868. He was educated at the Royal Military Academy, Woolwich, and was commissioned in the artillery in 1795. He served in the Irish Rebellion of 1798, and commanded the famous *'Chestnut Troop'* of the Royal Horse Artillery in the Peninsular War of 1809-14 and at Waterloo. He was appointed deputy adjutant-general of artillery at headquarters in 1840, and until his retirement in 1858 practically directed the British field artillery, and sent it to the Crimean War in the best condition of any part of the army. He was responsible for the establishment of the School of Gunnery at Shoeburyness and the Royal Artillery Institute at Woolwich. He reached the rank of field marshal in 1868, receiving also the G. C. B.

ROSS, Sir James Clark, English explorer: b. London, 15 April 1800; d. Aylesbury, Buckinghamshire, 3 April 1862. He was a nephew of Sir John Ross (q.v.) whom he accompanied

on the voyage in search of a northwest passage in 1818. Between 1819 and 1827 he accompanied Captain Parry upon his four Arctic explorations, and was a member of the expedition of his uncle in 1829-33. His discovery of the north magnetic pole in 1831 raised him to the rank of post-captain; but it was in his memorable voyage to the Antarctic Ocean in 1839-43 that he rendered his most valuable contribution to science. He succeeded in reaching lat. 78° 10', and discovered a great ice-bordered continent which he named Victoria Land, and an active volcano which was called Mount Erebus after the discoverer's ship. For these services he was knighted in 1844. In 1848 he was a member of the party which made an unsuccessful attempt to discover the fate of Sir John Franklin. He became rear-admiral in 1851. An account of his Antarctic expedition was published by him in 1847, entitled 'A Voyage of Discovery and Research in the Southern and Antarctic Regions.' Consult O'Byrne's *Naval Biographical Dictionary*; Markham, 'Fifty Years' Work of the Royal Geographical Society.'

ROSS, Janet Anne Gordon, English author: b. London, 24 Feb. 1842. A daughter of Sir Alexander Duff Gordon, she was married to H. J. Ross, a banker of Alexandria, Egypt, in 1860, was for three years Egyptian correspondent of the *London Times*, and since 1867 has lived in Italy. She has published 'Italian Sketches' (1887); 'Three Generations of Women' (1888); 'Leaves from our Tuscan Kitchen' (1899); 'Florentine Villas' (1901); 'Old Florence and Modern Tuscany' (1904); 'Florentine Palaces' (1905); 'Lives of the Early Medici' (1910); 'The Fourth Generation: Reminiscences' (1912). She was on terms of close friendship with George Meredith, and is the original of Rose Jocelyn in 'Evan Harrington.'

ROSS, John, American patriot: b. Ross-shire, Scotland, 29 Jan. 1726; d. Philadelphia, Pa., March 1800. After a mercantile experience of 20 years in Perth, he emigrated to America at the beginning of the rebellion of its colonies and became at once a staunch defender of the cause of independence. In June 1774, as chairman of the meeting of Philadelphia merchants in protest against British importations, he signed the agreement presented to the authorities and otherwise resisted unjust taxation.

ROSS, Sir John, English Arctic explorer: b. Balsarroch, Scotland, 24 June 1777; d. London, 30 Aug. 1856. He entered the navy at 9 and was promoted lieutenant in 1805. His first Arctic expedition was made in 1818, when, with Lieutenant Parry, he made a voyage in search of a northwest passage to the north pole. His second Arctic voyage was made in 1829 in a small vessel equipped at the expense of Sir Felix Booth, high sheriff of London, which proved inadequate for the purpose. The exploring party was frozen up in the ice for four winters, and was rescued in 1833 by Ross's old ship, the *Isabella*, in Lancaster Sound. He was knighted for his services in 1834, and made rear-admiral in 1851. In 1839 he was appointed consul at Stockholm, and served until 1846. He made an expedition in search of Franklin in 1850. He was the author of 'A Voyage of Discovery' (1819); and 'Narrative of a Second

Voyage in Search of a North-west Passage' (1835).

ROSS, John, or KOOWESKOOWE, Indian chief: b. Georgia, 30 Oct. 1790; d. Washington, D. C., 1 Aug. 1866. He was a Cherokee half-breed who became chief of his tribe in 1828. In 1817-19 Georgia attempted to remove the Cherokees from its borders through a bribe offered to Ross, who had received an English education and was a man of importance in his tribe. He exposed the attempt and continued to repulse the concerted effort of the people of the State to effect their removal. In 1829 Ross, as chieftain, successfully appealed to the Supreme Court of the United States against the action of the Georgia legislature in expelling his people; nevertheless the Cherokees were banished in 1838.

ROSS, Jonathan, American jurist and statesman: b. Waterford, Vt., 1826; d. Saint Johnsbury, Vt., 22 Feb. 1905. He entered Dartmouth College in 1847 and was graduated in 1851. He earned his early education by working on his father's farm during the summer, and by teaching school during the winter. After graduating, he taught in Craftsbury and was principal of the academy at Chelsea, Vt. Meanwhile he studied law and was admitted to the Orange County bar in 1856, practising until he was elected in 1870 as assistant judge of the Supreme Court. He was elected chief judge in 1890. Judge Ross was State attorney for Caledonia County 1862-66, represented Saint Johnsbury in the legislature 1865-66, and in 1869 was a member of the last council of censors held in the State. In 1870 he represented Caledonia County in the State senate was for several years a member of the State board of education, and early in 1899 was appointed by Governor Smith to succeed Justin S. Morrill in the United States Senate.

ROSS, Robert, British soldier: b. 1766; d. Baltimore, Md., 12 Sept. 1814. He was graduated at Trinity College, Dublin, in 1784, and was commissioned an ensign in the British army in 1786. He served in Holland in 1799, in Egypt in 1801, and later at Naples and in Spain. He was in command of a brigade sent to America in 1812; won a victory at Bladensburg, 24 Aug. 1814, and pushing on to Washington that evening took the city and burned the public buildings. He then moved upon Baltimore, but was mortally wounded and died before he could be returned aboard ship.

ROSS, Sir Ronald, British physician: b. 13 May 1857. He was educated in medicine at Saint Bartholomew's Hospital, London, and entered the Indian Medical Service in 1881. He began a special study of malaria in 1892, and won the Parker gold medal in 1895. He engaged in experimental verification of the mosquito theory of malaria in 1895; discovered the life history of malaria parasites in mosquitoes in 1897-98; and in 1899 headed the expedition which found the malaria-bearing mosquitoes in West Africa. He received the Nobel Prize in medicine in 1902 in recognition of his services in regard to malaria. He retired from the Indian Medical Service with the rank of major in 1899. He was appointed professor of tropical sanitation at the University of Liverpool and the Liverpool School of

Tropical Medicine; became physician for tropical diseases at King's College Hospital in 1913; and in 1914 was appointed consulting physician for Indian troops engaged in the European War. He was knighted in 1911. He was an editor of *Science Progress* and of *Annals of Tropical Medicine*. Author of many scientific papers, several novels and 'Philosophies and Other Poems'; 'Mosquito Brigades and How to Organize Them' (1901); 'Malarial Fever' (9th ed. 1902); 'Prevention of Malaria' (1910).

ROSS, Sir William Charles, English miniature painter: b. London, 3 June 1794; d. there, 20 Jan. 1860. He began exhibiting at the Royal Academy at 15. In 1821 his 'Judgment of Brutus' gained the gold medal of the Society of Arts. His most ambitious religious picture, 'Christ Casting out the Devils from the Maniacs in the Tombs,' exhibited at the Royal Academy (1825), was the last large canvas that he executed. Henceforth he devoted himself to miniature. He was knighted in 1842 and elected R.A. in 1843 and became the most fashionable painter of his time in his chosen department. He painted Queen Victoria, Prince Albert and their children, the King and Queen of the Belgians, the King and Queen of Portugal, Prince Louis Napoleon (afterward Napoleon III) and many English celebrities. The total number of these exquisite works, as calculated from his own memoranda, was 2,200. He wisely attempted to give to the miniature that breadth of treatment which distinguished Reynolds, whom he evidently took for his model. His drawing was invariably correct, and marked by a nameless elegance enhanced by the truthfulness and clearness of his flesh tints and his clever handling of textures. His miniatures are still considered the models of their class in England. He was an enthusiast in his profession and on his death-bed almost his last words were expressions of regret that photography would destroy the art of painting in miniature. Consult Williamson, 'History of Portrait Miniatures' (1904).

ROSS, William Potter, Cherokee Indian leader: b. at the foot of Lookout Mountain, Tenn., 28 Aug. 1820 d. Fort Gibson, 20 July 1891. His father was a native of Scotland and his mother was a sister of John Ross, who was principal chief of the Cherokee Nation from 1828 to 1866. His early education was obtained in the Presbyterian mission school at Will's Valley, Ala., and at the Greenville (Tenn.) Academy. He finished his preparation for college at the Hamil School, Lawrenceville, N. J., and then entered Princeton College, where he pursued the full classical course and whence he was graduated with honor, in 1842. The following year he entered public life as the clerk of the Cherokee senate. In 1844, he was selected as the first editor of the *Cherokee Advocate*. He subsequently filled other public positions in the Cherokee Nation. In the latter part of 1861, the Cherokee Nation entered into a treaty of alliance with the Confederate States and agreed to furnish a regiment of troops for the Confederate military service. This action was taken against the better judgment of William P. Ross but he felt himself bound by it. He was commissioned lieutenant-colonel of the Cherokee regiment which was

raised in compliance with the terms of the treaty. The regiment became demoralized and practically ceased to exist soon after the battle of Pea Ridge, Ark., in 1862. He accepted a parole as a Confederate officer and took no further part in the war. He was an active participant in the Indian peace council which was convened at Fort Smith, Ark., in September, 1865. After the death of Principal Chief John Ross, in August, 1866, William P. Ross was elected as his successor for the unexpired term. In 1867, he was one of the commissioners deputed by the Cherokee Nation to negotiate the agreement with the people of the Delaware tribe whereby the latter were incorporated into the citizenship of the former. He was a prominent and active participant in the annual inter-tribal councils which convened at Okmulgee between 1870 and 1878. At the first of these councils, which held sessions in September and December 1870, he was named as chairman of the committee which framed 'the Okmulgee Constitution,' proposed and submitted as an organic union of the several tribes in the Indian Territory. In 1873, upon the death of Principal Chief Lewis Downing, he was again elected to fill an unexpired term. After retiring from public life, in 1875, he assumed the editorship of the *Indian Journal* at Muskogee, and subsequently he filled similar positions on the *Indian Chieftain*, at Vinita, and the *Indian Arrow*, at Fort Gibson and Tahlequah. He was a man of remarkably versatile attainments, interested in agriculture and horticulture and in the cause of education, a talented writer, an orator of power and eminent as a lawyer.

ROSS, The Man of (real name JOHN KYRLE), English philanthropist: b. Dymock, Gloucestershire, 22 May 1637; d. Ross, Hertfordshire, 7 Nov. 1734. He was educated at Balliol College, Oxford, and lived thereafter on his estates at Ross. Possessed of large means he lived in the simplest manner and devoted his time and income to the general good of the countryside. He was made famous as 'The Man of Ross' by Pope, who wrote of him in 'Moral Essays' (Vol. III).

ROSS FAMILY, The, prominent in the creation of the United States flag. The 3rd Continental Congress, 14 June 1777 adopted the report of Gen. George Washington, Robert Morris and George Ross, and declared that the national flag of the United States shall be, of stars and stripes, red, white and blue. George Ross a member of the flag committee, also a signer of the Declaration of Independence, suggested that the widow of his nephew Col. John Ross, be chosen to make the new cloth flag. George Ross was three times chosen a delegate to the Continental Congress. He was a judge; he died in 1779, age 49.

When the Revolution broke out the family of the Rev. George Ross went with the colonists, except one son, who as a learned and influential attorney remained true to the king, and managed to make untold trouble for the family of Ross as well as all the other "Rebels" as he earnestly termed them. The other son of the Reverend Ross was a man of more courage and daring; he asserted himself and became one of the eloquent men who assisted in arousing the people of Philadelphia to resist

the demands of the king, and if needs be, to greet the newly arrived soldiers with the outstretched sword. His independent nature so impressed itself upon the community that he was sent with Benjamin Franklin and others as delegates to the Continental Congress which in 1776 framed and signed the Declaration of Independence. Wonderful as was his record in this convention of giants, he will be ever remembered as having been the man who was eager to have a flag for the continental army which would be emblematic of all the colonies, and when the committee was appointed to design a national banner, George Ross was placed with General Washington and Robert Morris, as a committee to prepare such a symbol. It was probably he, rather than Washington who suggested Mrs. Betsy Ross as the proper person to make that flag, although she was known to Washington, as she had for many years made some of the fancy vests of George, and her laces were in evidence on a few of General Washington's coat sleeves. But it was most likely that George Ross suggested that they call on his nephew's widow, Mrs. Elizabeth Ross, as she was not only the handiest, most dexterous needle worker in the Quaker City, but since her husband had recently been buried, death resulting from his heroic service in the continental army, and since she was continuing the dead soldier's business, that of upholstering, she was not only deserving this compliment but needed the money. Robert Morris, too, knew her well, and he like the other distinguished men of Philadelphia were embroidered and belaced by her dainty threads of silk and satin. While it is uncertain which of the committee suggested her, though the evidence seems to point to, George Ross (his sister was the wife of a signer of Declaration of Independence, George Read), the facts are she did make the flag, and made it according to a design agreed upon by the committee.

Her husband, John, was a volunteer and he was the son of the third son of Rev. George Ross who came from Scotland; his name was Amos and he was the rector of Trinity Church, Philadelphia, and his fame as an orator lives to this day in the records of the church. John was in the service of the continentals and while guarding the powder at a wharf, the explosion which took place killed him and destroyed valuable property. This accident took place in January 1777. See UNITED STATES FLAG.

But our colonial dame did not remain a widow long, in fact while she was stitching the new flag, on 13 June, her mind was not only on the wedding of the colonies into one great nation, but was also more deeply interested in her second wedding which was held over until the flag was approved or adopted—for on 14 June 1777 the Continental Congress accepted the emblem and on the next day, Sunday, 15 June, she was married to Joseph Ashburn a sea captain.

She continued to make flags for the government while her newly wed half kept up his sea service. His boat was sailing in the interests of the continentals and he was captured by the British and taken to English land where he was confined in a prison near Portsmouth. Here he died in March 1782. John Claypoole, a young Philadelphian, also a prisoner, was later

released and upon his return to Philadelphia visited Mrs. Betsy Ashburn some time in May. While the colonial dame was busy making the flag, Claypoole was busy making love and Betsy finished her task on 13 June while Claypoole completed his task 15 June and on that day Betsy Griscom-Ross-Ashburn-Claypoole, began a new life of romance. To this marriage was born four daughters. The "Widow Ross" who made our first flag and her daughters for many years after were employed to make the government flags. On 30 Jan. 1835, she died at Philadelphia at the age of 84. Her maiden name was Griscom, she was the daughter of Samuel Griscom, a builder. She was a worshipper at Christ Church, Philadelphia, where her pew is now marked with a brass tablet; she was buried at the south Fifth street God's acre, but in 1857 her remains were transferred to a lot in Mount Moriah Cemetery where a well-marked grave is kept in floralized form, by the Daughters of the Revolution. On a tall hickory flag pole daily from sunrise to sunset, floats the "Star Spangled Banner" over the remains of the woman, who first formed it into a thing of beauty and a joy forever. (See FLAG DAY). The Ross who planted the family in America came from Scotland where he was born 1676, just 100 years before the Declaration of Independence. He was a Presbyterian minister but later left that church and joined the Episcopalian creed. Immediately after this religious change he came to America, and landed at Delaware, where he rapidly grew in the favor of the entire New World and he was known as one of the most learned and popular in the colonies at that period. He was chaplain to a number of proprietary governors.

LIEUT. B. J. CIGRAND, U. S. NAVY,

Author of 'Real History of U. S. Flag.'

ROSSA, O'Donovan (real name JEREMIAH O'DONOVAN), Irish political agitator: b. Rossa-Carbery, near Skibereen, County Cork, 1831; d. New Brighton, Staten Island, N. Y., 25 June 1915. He joined the Phoenix Society in 1856, and in the course of its transformation from a literary to a revolutionary society became one of its leaders. He was an advocate of the most extreme and violent measures and was nicknamed "Dynamite Rossa." With other members of the Phoenix Society he was arrested for political activities in 1858 and was imprisoned for six months, but was released on a plea of guilty. He emigrated to America in 1862 and continued actively to promote the Fenian cause. Returning to Ireland in 1863 he became connected with the Fenian organ, *The Irish People*. The paper was seized in 1865, and O'Donovan was held on a charge of treason-felony. He was sentenced to imprisonment for life, but was released under an amnesty act of 1871 and banished for life. He returned to the United States, became a naturalized citizen, and continued his work against the British government, publishing the *United Irishman* in New York. Upon the expiration of the 20 years of his banishment necessary to be served he was permitted to visit Ireland, and remained there in 1891-1900. He spent the remaining years of his life in the United States.

ROSSBACH, rös'bäch, Germany, village in Prussian Saxony, 8 miles southwest of Merseburg. It is famous as the scene of the victory

won 5 Nov. 1757, by Frederick the Great over the allied French and Imperial Armies under Charles de Rohan, Prince de Soubise; Joseph Frederick William, Duke of Saxe-Hildburghausen; and General Tildzeugmeister of the empire. The Prussians were heavily outnumbered, but won an important victory, the entire action consuming only one and one-half hours.

ROSSE, rös, William Parsons, 3d EARL OF, British astronomer: b. York, 17 June 1800; d. Monkstown, Ireland, 31 Oct. 1867. He was educated at Dublin University and at Magdalen College, Oxford, where he was graduated in 1822. He was member of Parliament for King's County from 1823 to 1834, and succeeded his father in the earldom in 1841. In 1845 he was elected a representative peer of Ireland, but took little interest in politics. During the stormy discussions on the first reform bill he was occupied with the construction of his first famous reflecting telescope, the speculum of which had a diameter of three feet, and was soon superseded by one of double the size. The two great defects which had hitherto baffled opticians in constructing large reflecting mirrors were spherical aberration and absorption of light by specula, and in the casting of those of large size there arose the apparent impossibility of preventing cracking and warping of the surface on cooling. Even the proper admixture of the metals for the reflector had to be ascertained by numerous and costly experiments. At last, however, a gigantic speculum, weighing three tons, was turned out without warp or flaw and was then polished and mounted on a telescope 52 feet in length in Lord Rosse's park at Parsonstown, at a cost of \$150,000. The sphere of celestial observation was immensely widened by an instrument so powerful; nebulae which had defied Herschel's telescope were resolved into stars and new nebulous mist was revealed to the observation. The construction of the telescope, effected under the earl's direction and superintendence, is fully described in the 'Philosophical Transactions of the Royal Society, of which body he was president, 1849-54.

ROSSELLI, rös-sèl'lè, Cosimo, Italian painter: b. Florence, 1439; d. there, 1507. He was a pupil of Neri di Bicci, the representative of the early Florentine school and this school furnished the guiding principles of his artistic life, which was especially influenced also by the work of Benozzo Gozzoli. The altar-pieces and frescoes which he produced were filled with figures dressed in the costumes of his day, and the realistic minuteness of his faces seems to suggest that they were portraits of his contemporaries. He was in short a genuine Pre-Raphaelite of the Florentine school. His finest work is a fresco in the chapel of Saint Ambrogio at Florence: 'The Exhibition of a Miracle-working Chalice,'—a fashionable religious function of old Florence, displaying the silks, laces and jewelry of the time in all their splendor. Among other good works of his may be mentioned 'The Coronation of the Virgin' and an 'Assumption,' both at Florence. He was called to Rome in 1480 by Sixtus IV, and contributed to the decoration of the Sistine Chapel, with the approval of the Pope, who admired his lavish use of gold and ultramarine. Among his pupils the most celebrated were Pietro di Cosimo and Fra Bartolommeo (q.v.).

He produced few easel pictures, but one of these, 'The Annunciation' (1486), was sold in 1847 for \$1,627 in England.

ROSSELLINI, rös'sèl-lè'nè, The, a surname applied to the five sons of the Florentine, Mattio di Domenico Gambarelli; all of whom attained distinction in the fine arts and of whom the oldest and the youngest, Bernardo and Antonio Rossellino (qq.v.) became famous sculptors, while Domenico, Maso and Giovanni also did excellent work. Consult Bode, W., 'Die Italienische Plastik' (1882).

ROSSELLINO, Antonio (real name GAMBARELLI), youngest of the Rossellini (q.v.), Florentine sculptor: b. about 1427; d. about 1479. Little is known of his life except that he was a pupil of his elder brother, Bernardo (q.v.) and that his work was influenced by Donatello and Alberti. His work is characterized by great beauty and delicacy. He is best known for his tomb of the young cardinal prince Portogallo in San Miniato, Florence, which he executed in 1461. He copied it with some slight changes for the tomb of Mary of Aragon, wife of the Duke of Amalfi, in the church of Mount Oliveto, Naples.

ROSSELLINO, Bernardo (real name GAMBARELLI), Florentine sculptor and architect, eldest of the Rossellini (q.v.): b. Settignano, 1409; d. Florence, about 1464. He studied under Alberti and also gained something of his mastery through study of the work of Donatello. Under popes Nicholas V and Pius II he made restorations of the famous buildings of ancient Rome and restored Saint Peter's and the Vatican, but this work is largely lost through alterations made in the 17th and 18th centuries. He built the palaces at Oliveto and Spoleto and the baths at Viterbo; as well as a palace, a cathedral and city hall at Pienza, the native town of Pope Pius II, previously known as Cosignano. The monument to Leonardi Bruni in Santo Croce was executed by him in 1444; and busts of Saint John and Battista Sforza are among his other works.

ROSSER, Thomas Lafayette, American soldier and civil engineer: b. Campbell County, Va., 15 Oct. 1836; d. 29 March 1910. He entered West Point from Texas in 1861, but when President Lincoln ordered that class into the field after the attack upon Fort Sumter, Rosser resigned and entered the Confederate army, in which he was appointed 1st lieutenant of artillery and later captain. In 1862 he was made lieutenant-colonel and shortly afterward colonel of the 5th Virginia regiment under J. E. B. Stuart. In 1864 he became major-general in the army of Northern Virginia. He refused to surrender at Appomattox; escaped through the Federal lines, and while trying to reorganize scattered troops was captured and made a prisoner of war. After the war he studied law, but did not practice. In 1868 he became assistant engineer in the construction of the Pittsburgh and Connellsville Railroad; engaged on the Northern Pacific in 1870, becoming the next year chief engineer of its construction through Minnesota, Dakota and Montana; in 1881 became chief engineer of the Canadian Pacific Railway. In 1886 he returned to Virginia to reside, and in the war with Spain in 1898 commanded a volunteer brigade.

ROSSETTI, rōs-sēt'tē, Christina Georgina, English poet, daughter of Gabriele Rossetti (q.v.): b. London, 5 Dec. 1830; d. there, 29 Dec. 1894. She was educated at home. Her first verses were written in 1842 and printed in the private press of her grandfather, Gaetano Polidori. She was probably her brother Dante's first model, and many portraits of her exist both as portraits and as figures in his paintings. A volume of her verse came from the Polidori press in 1847 and, later after the establishment of 'The Germ' in 1850 she contributed to it under the name of "Ellen Alleyne." Of a deeply religious temperament, she was a devoted High Churchwoman and her writing, aside from devotional manuals and strictly religious works, was mainly poetry of a devotional character. 'Goblin Market,' however, published in 1862, is not of this type; and for original and purely imaginative qualities was never afterward approached by her. She also wrote 'The Prince's Progress' (1866); 'A Pageant' (1881); stories and nursery rhymes under the titles, 'Commonplace' (1870), and 'Sing Song' (1872); 'Verses' (1873), and such religious works as 'Annus Domini' (1874); 'Called to be Saints: the Minor Festivals' (1881); 'Time Flies: a Reading Diary' (1885); 'The Face of the Deep' (1892). From 1871 to her death she was for most of the time an invalid. Consult Mackenzie Bell, 'Christina Rossetti: a biographical and critical study' (1898).

ROSSETTI, Dante Gabriel, English poet and painter: b. London, 12 May 1828; d. Berchington, 10 April 1882. His full name was Gabriel Charles Dante, but for literary purposes he rearranged it in the form by which he is now remembered. He was one of four children, all of whom, especially himself, his sister Christina and his brother William Michael, achieved fame in literature. His father, Gabriele Rossetti, professor of Italian in King's College, was an Italian exile, an enthusiastic patriot, himself a poet and author of several critical works on Dante. He had married Frances Mary Lavina Polidori, of English and Italian blood.

Dante Gabriel was educated at home, in an atmosphere of culture and fine enthusiasms; from his ninth to his 14th year he attended King's College. During that time he received some instruction in drawing, and upon leaving college he gave himself to the study of art, entering the Royal Academy in 1848. At the same time he began his translations from Dante and other Italian poets, showing from the first more genius in poetry than in painting. His great poem, perhaps his most remarkable, 'The Blessed Damozel,' was written about 1847. In 1848 he entered the studio of Ford Madox Brown, where he met Woolner, Holman Hunt and Millais—the group that with himself and Madox Brown constituted the so-called pre-Raphaelite brotherhood. In 1850 William Michael Rossetti edited *The Germ*, a short-lived but famous magazine devoted to pre-Raphaelite ideals; in its page appeared 'The Blessed Damozel' and other work of Dante Gabriel Rossetti's. Just what were the ideals of the pre-Raphaelites is hard to define; they stood in general for the devotional sincerity in art of those painters who preceded Raphael, and for freedom from modern academic canons; yet Rossetti himself was not strictly a pre-Raphaelite;

his drawing was quite in his own style, little affected by the manner of the old painters.

For some time Rossetti had to face the proverbial artist's struggle; his pictures were not bought, and the peculiarities of his drawing were severely criticized. Ruskin's kindly defense of the pre-Raphaelites, however, encouraged the whole group. Shortly afterward Ruskin made Rossetti a standing offer to buy, up to a certain sum, all of Rossetti's painting that pleased him. The arrangement lasted for some time, to Rossetti's great benefit. Through Ruskin he met Sir Edward Burne-Jones, who introduced him to Morris and Swinburne. Ruskin also generously assumed the cost of Rossetti's first volume, the 'Early Italian Poets,' a collection of translations which appeared in 1861. Rossetti afterward paid back the loan, and the book was reprinted in 1874 under the title of 'Dante and His Circle.'

In most of Rossetti's early pictures, his Beatrices and ideal ladies were copied after his wife, Elizabeth Eleanor Siddal, herself a poet and artist, whom he had married in 1860. Mrs. Rossetti was an invalid; the poet had no delusions as to the sadness shortly in store for him. But when, in 1862, his wife accidentally hastened her fate by an overdose of laudanum, Rossetti gave way impetuously to his grief, and in his impulsive despair buried in his wife's coffin the manuscript of his poems, for the most part inspired by her.

In the course of the next seven years—during which time he continued his painting with success, and also began the use of chloral—his friends persuaded him to recover his manuscripts, which he did in 1869. The following year appeared his 'Collected Poems,' containing the 'House of Life' sonnet sequence in its original complete form. In October 1871, Robert Buchanan, under the pen-name of "Thomas Maitland," wrote an essay entitled 'The Fleshly School of Poetry,' in the *Contemporary Review*. The purpose of this article was to show that Rossetti's poetry, in thought and expression, was indecent; and to make his point the writer did not shrink from misquoting Rossetti and perverting his meaning. Rossetti made an adequate reply in an article called 'The stealthy School of Criticism,' and in later editions somewhat unnecessarily withdrew the verses that had most offended Buchanan. But the injustice of the attack preyed upon him until his mind was deranged; at one time only the loving care of his friends prevented him from committing suicide.

He partly recovered his mental poise, and for a time entirely recovered his poetic and artistic faculties, which seemed at first not to be affected by his use of chloral. Several of his best pictures belong to this time; the 'Ballads and Sonnets' were published in 1881. These last years, however, were years of pitiful suffering and gradual collapse. His friends sheltered him from his worst moods and cared for him to the end.

In both painting and poetry Rossetti's personality expressed itself with unusual evenness throughout his career, and in 'The Blessed Damozel,' one of his earliest poems, almost all his qualities can be traced. Like so much of his other writing, it was illustrated, set to painting, as it were, by himself; but without such aid the pictorial genius is strong in the

verse. The ideas are typically concrete; not only the Damozel, leaning on the bar of Heaven, is seen, with the lilies in her hand, and on earth the fall of autumn leaves, and in the sky the "curled moon"; but from all points of view the appeal is to the eyes, as in that imaginative glimpse of the world spinning far below the bridge of Heaven; and in the picture of souls ascending to God like thin flames—such as William Blake could have drawn; and in that "strong level flight" of the angels. The three lilies in the Damozel's hand and the seven stars in her hair, and the five handmaidens of the Virgin are definitely numbered for the effect of concreteness; Rossetti habitually employs the device, as Keats employed it in the 'Belle Dame Sans Merci,' after the manner of the old English ballads—a manner that strongly influenced Rossetti. Partly from the ballads 'The Blessed Damozel' derived some of its mediæval flavor; but the quality was really personal with the poet. Here as in his other poems Rossetti manages to reproduce the romance of the archaic, without any great reproduction of the archaic itself. The furnishing of Heaven in the poem is quaint and remote, in effect like the lovely names of the five handmaidens; but the thought or attitude of no particular past time is revived. Perhaps some of this pseudo-archaic flavor comes from the strange verse-music, which Rossetti introduced into English. The secret of much of its charm is veiled in the poet's genius, but its most striking trait, its melancholy evenness, can be explained by Rossetti's training in Italian prosody. In writing English poetry he departs radically from the genius of English metre; instead of fitting the words, with their natural accents undisturbed, into the regular beat of the verse—so placing them that the natural reading of the line would determine the rhythm,—Rossetti allows a preconceived rhythm to determine the accent of the words, as in the line "With her five handmaidens, whose names," etc.

These characteristics of 'The Blessed Damozel,' and others besides, reappear more marked in other poems—the subtlety of thought, in 'Love's Nocturne'; the mediæval mood of devotion, altogether or almost religious, in 'Ave,' and in 'The Portrait,' with its splendid closing image; the ballad element, together with the unusual skill in reproducing physical sensation, in 'Eden Bower,' 'Troy Town,' and the longer ballads; and the same sad, even music in them all. Among his other verse the elaborate ballads—'Rose Mary,' 'The White Ship,' 'The King's Tragedy,' show Rossetti's debt to ballad literature, and at the same time mark the wide gulf between the clear simplicity of the old narratives and the wrought loveliness of his work. In his shorter ballads, however, such as 'Stratton Water,' he is much simpler. What hold he had on real life is powerfully concentrated in 'Jenny,' probably his most thoughtful poem.

Rossetti's sonnet sequence, 'The House of Life,' undoubtedly places him among the masters of the sonnet form, though none of the sonnets, perhaps, are so well known as 'The Blessed Damozel.' Technically, they have more of the rise and fall of the best Italian models than is usual in English poetry, and at times, as in the first sonnet, or the 24th or the 25th, their cadence is superb. But in many of them the mystical subject matter is baffling, and Rossetti's

characteristic evenness of manner, here also an evenness of mood, makes the sequence monotonous at last. Perhaps Rossetti's best sonnets were written singly for pictures—as the beautiful 'Lilith,' and the 'Venus Verticordia,' with the three wonderful lines at the end.

The most widely known of Rossetti's translations are the three from Villon, especially the 'Ballad of Dead Ladies,' and Dante's 'Vita Nuova.' In all of his translated verse, however, the same traits are found as in his original work—the same exquisite, rather than great mood, the same concrete, yet remote, aspects of beauty, and the same un-English music of the verse. He has many imitators in both his arts. See HOUSE or LIFE.

Bibliography.—The best edition is by W. M. Rossetti. For biography and criticism, consult Introduction to the above; 'Dante Gabriel Rossetti; His Family Letters,' with memoir by Rossetti, W. M.; Caine, Hall, 'Recollections of Dante Gabriel Rossetti'; Pater, Walter, in 'Appreciation'; the same essay in Ward's 'English Poets.' Recent studies are by Benson, A. C. (1906); Marellier (1901); Singer (1908), and Symons, Arthur (1909).

JOHN ERSKINE,
Adjunct Professor of English in Columbia University.

ROSSETTI, Gabriele, Italian poet: b. Vasto Abruzzo Citeriore, 28 Feb. 1783; d. London, England, 26 April 1854. He was educated at the University of Naples and in 1814 was appointed curator in the Museum there. He joined the Liberals and in 1815 became a member of the secret society of the Carbonari. He was a supporter of the constitution which King Ferdinand was forced to grant as the result of a military uprising, and when in 1821 the constitution was abrogated and its adherents proscribed, Rossetti was compelled to fly the country. He went first to Malta and in 1824 to London, where he was engaged as a teacher of languages and was elected professor of Italian at King's College, London, in 1831. In his political opinions he continued an ardent Liberal, but was in favor rather of a constitutional monarchy than a republic. In religion, though never wholly abjuring the Roman Catholic creed, he was for many years practically a free thinker, though in later years he accepted an undogmatic form of Christianity. In 1845 blindness compelled his resignation from the college. His works include 'Dante, Commedia' (1826); 'Lo Spirito antipapale che produsse la Riforma' (1832); 'Poems' (1833); 'La Beatrice Dante' (1842); 'Il veggente in solitudine' (1846); 'L'arpa evangelica' (1852), etc.

ROSSETTI, William Michael, English poet and art critic, son of Gabrielle Rossetti (q.v.); b. London 25 Sept. 1829. He was educated at King's College, London, and entered the excise office in 1845. From 1869-94 he was assistant secretary to the board of inland revenue. He has published blank verse translations of Dante's comedy 'The Hell' (1865); 'Lives of Famous Poets' (1878); 'Life of Keats' (1887); 'Memoir of Dante G. Rossetti' (1895); 'Gabriele Rossetti' (translated autobiography 1901), etc., besides much editorial work, including the works of many poets and

the 'Rossetti Papers' (1862-70-1903), and 'Some Reminiscences' (1906).

ROSSI, Francesco de, rös'sē, known as Il Cecco di Salviati, Italian painter: b. Florence, about 1510; d. Rome, 1563. He was a pupil of Michelangelo and Parmigiano and a painter of history and mythological subjects. Little is known of his life, excepting that he went to France, made enemies by his eccentric conduct and reckless wit, and found little patronage there. He is said by Vasari to have decorated many Italian palaces, and there are examples of his work in several of the great European collections, including his 'Charity' in the English National Gallery, and his 'Holy Family' in the Prado Gallery, which show him to be somewhat mannered in execution, but none the less a painter of the Florence school at its best.

ROSSI, Giovanni Battista de', jō-vān'ne bāt-tēs'tā dā, Italian archaeologist: b. Rome, 23 Feb. 1822; d. there, 20 Sept. 1894. He was distinguished for his studies of the inscriptions of the early centuries of the Church, and made important discoveries in the catacombs. He was made a member of the Berlin Academy of Sciences and corresponding member of the French Institute. He published 'Inscriptiones Christianæ Urbis Romæ septimo Sæculo Antiquiores' (1861); 'Roma Sotteranea Christiana' (1864-77).

ROSSI, Pellegrino Luigi Edoardo, COUNT, Italian statesman, jurist and economist: b. Carrara, 13 July 1787; assassinated Rome, 15 Nov. 1848. He was educated at the universities of Pavia and Bologna and was appointed to the chair of law at Bologna in 1812. He espoused the cause of Joachim Murat and after his fall in 1815 he escaped to Geneva. There he became professor of criminal law at the academy, was honored by naturalization as a citizen and in 1820 became a deputy in the Cantonal Council. In 1832, as a member of the Extraordinary Diet, he was commissioned to draw up a revised constitution, known as the 'Pacte Rossi,' but which was rejected by the Diet, an outcome which caused him to accept an invitation to France. In 1833 he succeeded Say as professor of political economy at the Collège de France, and in 1834 he became a French citizen and was appointed professor of constitutional law. He was sent to Rome as French Ambassador in 1845, but in 1848, after the fall of Louis Philippe, he resumed his status as an Italian subject. He was named Minister of the Interior by Pius IX, but although a statesman of pronounced ability his conservatism in opposing the formation of an Italian confederation made him unpopular and his assassination followed. His greatest fame rests upon his work as an economist. Author of 'Traité de droit pénal' (1829); 'Cours d'économie politique' (1838-54); 'Cours de droit constitutionnel' (1866-67); 'Mélanges d'économie politique, d'histoire et de philosophie,' published posthumously (2 vols., 1857), etc.

ROSSINI, Gioachimo Antonio, jō-ā-kē'mō ān-tō'nē-ō rös-sē'nē, Italian composer: b. Pesaro, 29 Feb. 1792; d. Passy, near Paris, 13 Nov. 1868. He was born of poor parents, and when only 10 was able to support his mother by singing solos in church. He also

took the part of Adolfo in Paer's 'Camillo' at the theatre of the Commune—his only appearance as a dramatic singer. He began his musical studies with his parents, but later he studied composition and counterpoint under Tesei and Mattei, both of Bologna. His first opera, 'Demetrio e Polibio,' was composed before his studies under the latter, and even at that stage of his career he had mastered the art of imbuing his music with feeling. His first public appearance as a dramatic composer was at Vienna in 1810, when his opera 'La Cambriale di Matrimonio' was performed. Successful though it was, it did not contain any definite evidence of power to assert a new school or create a radical change in style. It had been preceded in 1808 by 'Il Pianto d'Armonia per la Morte d'Orfeo,' a cantata, which gained the prize at the Liceo and was performed in public on 8 August of that year. His next composition was 'Didone abbandonata,' a cantata, followed by an opera buffa, 'L'Equivoco stravagante,' which brought him fresh triumphs. Early in 1812 he produced two comic operas, 'L'Inganno felice' and 'L'occasione fa il Ladro, ossia il Cambia della valigia,' each of which contained several songs full of force and original melody. He attempted one oratorio, 'Ciro in Babilonia,' which unhappily proved a failure. In the autumn of 1812 he wrote a musical two-act comedy, 'La Pietra del Paragone,' produced at the Scala with immense success. In the finale occurs the first instance of his employment of the *crescendo*, for which he became famous later, and which Mosca declared had been borrowed from his own 'Pretendenti delusi.' In 1813 Rossini composed 'Tancredi,' an opera based on Voltaire's drama, full of good situations and patriotic sentiment. Its choruses are rich in martial passages. 'Di tanti palpiti' became popular everywhere and made Rossini the most famous composer living. During that year he also wrote 'L'Italiana in Algeri,' containing the charming trio 'Papataci' and the patriotic air 'Pensà alla Patria.' During the next two years Rossini wrote eight operas, including the well-known 'Barbiere di Siviglia' and 'Otello,' while in 1817 he produced his celebrated operas 'La Cenerentola,' 'La Gazza ladra' and 'Armida,' but critics still regarded him as a 'mere musical figure-maker and a diluter of melody into mere ornament.' 'Ermione,' his next opera, has been styled a 'system of word-painting.' His next notable compositions were 'Adelaide di Borgogna' (or 'Ottone Ré d'Italia,' as it is sometimes called), and another oratio, 'Mosè in Egitto.' The former was produced during the Carnival of 1818 and was warmly received, and the latter at the San Carlo in Naples. During the summer of 1818 he wrote 'Adina, o il Califfo di Bagdad' for the San Carlo Theatre in Lisbon, and 'Ricciardo e Zoraide' for the San Carlo in Naples, an opera full of ornament. His 'La Donna del Lago' seemed to show that Scott's works were becoming popular even in Italy. In this opera and others that followed, such as 'Maometto,' 'Zelmira,' 'Semiramide,' etc., it was plain that Rossini was half a century ahead of his day. His style was changing; his gaiety had disappeared; he was becoming serious. He now visited England, on the invitation of the manager of the King's Theatre in London, to write an opera for that house, to be called 'La Figlia

dell' Aria,' for which he was to receive about \$1,200. He arrived in London in December 1823, with his wife, Isabella Colbran, a singer, to whom he had been married about two years, and while there was much lionized. He acted as accompanist at numerous soirées, gave several concerts, singing the solos on two occasions in a cantata which he had composed for the occasion under the title 'Homage to Lord Byron,' and in five months had acquired nearly \$35,000. He then undertook the musical direction of the Théâtre Italien in Paris for 18 months at a salary of about \$4,000 a year. He here reproduced some of his operas, for example, 'La Donna del Lago,' 'Semiramide,' 'Zelmira,' etc., and also brought out a new one—'Il Viaggio a Reims, ossia l'Albergo del Giglio d'Oro'—composed for the coronation fêtes of Charles X. The sinecure positions of "Premier compositeur du roi" and "Inspecteur Général du Chant en France," were now given him, with an annual income of 20,000 francs, or about \$4,000. He then revised the music of 'Maometto,' brought out under the title 'La Siège de Corinthe,' and also reproduced 'Mosè,' with many improvements and additions, some of the interpolated airs being taken from 'Armida' and 'Ciro in Babilonia.' He next resolved to try his skill at lyric opera and adapted to the 'Le Comte Ory' some of his favorite music in the 'Il Viaggio a Reims,' but it is said that the best part of the drinking chorus was borrowed from Beethoven's Eighth Symphony. His next opera, commonly regarded as his masterpiece, was 'Guillaume Tell,' which was produced at the Académie on 3 Aug. 1829.

With its completion the prolific career of the composer may be said to have ended, for though he lived nearly 40 years longer, a few songs, his 'Stabat Mater' and the 'Petite Messe Solennelle' are about all he wrote. These 40 years were spent at Bologna and at Passy, where he died.

Determining to revisit Bologna, where his mother had died in 1827 and where his father was still living, he resigned his post, but made an agreement with the government to compose operas for the French stage for the next 10 years, and to produce one every two years, receiving 15,000 francs for each. Should this plan not be carried out, he was to receive a pension of 6,000 francs. On account of the abdication of the king of France and the Revolution of 1830, he returned in November 1830 to Paris. The new government, however, was not willing to recognize the agreement above mentioned, and for several years he fought his case in the courts, it being eventually decided in his favor. During this time he wrote his 'Stabat Mater.' In 1836 he again left Paris for Bologna, where his father died in 1839. He now wrote a number of songs and choruses, among which may be cited 'Inno popolare,' for the accession of Pius IX. His wife died in October 1845 and two years later he married Olympe Pelissier, whom he had met in Paris. In 1855 he again returned to Paris. His 'Petite Messe Solennelle' was produced on 14 March 1864 and he afterward scored it for a full orchestra, in which form it was given at the Théâtre Italien on 28 Feb. 1869, three months after his death. "Next to the Emperor," writes one of his biographers, "he became the first man in this city of arts and artists."

Rossini's position among the world's greatest composers has been much discussed. His joyous disposition and light-heartedness have been used as arguments against classing him with such profound composers as Mozart and Beethoven, the latter of whom is recorded as having characterized Rossini's work as "degrading the art in general wantonness with a negligence bordering on frivolity." It has been often said that Rossini's melodies are conspicuous for great sweetness and wonderful sensuous attraction, as for instance in the first finale of 'Cenerentola,' or as evidenced by the jolly roguery of the 'Barber of Seville.' This is unquestionably true and these are the fruits of his special form of genius. They are his natural endowment and probably if he had at that time tried ever so hard to write in a different vein he would have failed. His melodies were intended to please the public, for whom he wrote, and they fulfilled their mission to perfection. That he accomplished much for music cannot be gainsaid, and especially for operatic music in Italy.

Notwithstanding the immense popularity of Rossini's compositions, there have been pointed out certain peculiar features repeated over and over again which have caused some of his critics to temper their praise. Nor were these peculiarities entirely of Rossini's own creation, some of them having been borrowed from the works of Generali, Velluti and others. Prominent among them is the use of the crescendo, "which," says one, "appears as regularly and invariably in his overtures and finales as horse-radish with a joint of roast beef." The constant use of triplets is another mannerism which has provoked adverse criticism, while the undue prominence of appoggiaturas (leaning notes), in many cases of longer duration than the harmonic notes to which they are attached, has also been condemned, as well as his practice of closing his periods by modulating them from the major tonic to the minor mood of the lesser third below, or of the great third above the major tonic. A more serious charge made against him was that of plagiarism, it being stated that besides resorting to the national airs of Italy, he availed himself to a great extent of the ideas of Generali, Cimarosa and other Italian composers, as well as of several German composers, such as Haydn, Mozart, Krommer, etc. Thus, while no competent critic has denied that Rossini possessed genius of an extraordinary character, many are inclined to believe that his inventive faculties were confined within quite measured limits.

In spite of all this, there can be no doubt that his compositions form a memorable epoch in the history of musical art. It was he, moreover, who substituted singing for the endless recitatives which had been in vogue and he also gave the bass voice a leading part, insisting too that a singer should sing the notes of the composer without any additions of his own. He also made the chorus an important feature and fortified the orchestra by adding wind instruments to the strings, which alone had hitherto been used.

It cannot be questioned that wherever his operas appeared, they became firmly established and in many instances almost banished the classic works of the great masters who had preceded him. Thus, in Italy, they nearly supplanted the works of Pæsiello, Mayer and

others, including even Cimarosa. In Germany the national predilection was for graver music, but even there Rossini was, as one of his biographers put it "lord of the ascendants." While he rarely, if ever, reached the tragic grandeurs of Gluck, or the intense feeling of Mozart and Weber, his music is never dolorous and heavy, as is the case with some of the best compositions of the German school. Forceful and precise rhythm is another of his principal characteristics, while his scores are notable for their simplicity of outline and primary conception, although his manner of decorating the framework was at times intensely florid. Consult biographies by Beyle-Stendhal (1823; new ed., 1892); Azvedo (1865); Edwards (Boston 1881); Zanolini (1875); Bevan, W. A., 'Rossini' (New York 1905); Dauriac, L., 'Rossini' (Paris 1905); Corradi, E., 'Gioachino Rossini' (Rome 1909); Sittard, J., 'Rossini' (Leipzig 1882).

ROSSITER, rōs'ī-tēr, Thomas Pritchard, American artist: b. New Haven, Conn., 29 Sept. 1817; d. Cold Spring, N. Y., 17 May 1871. He early developed a talent for art and secured Jocelyn of New Haven as his instructor. He studied in Rome 1840-46, and on his return opened a studio in New York, where he was elected a National Academician in 1849. He painted historical and religious subjects, and was an admirable colorist.

ROSSLAND, rōs'land, Canada, an incorporated city since 1897, in the West Kootenay District, British Columbia, on the Canadian Pacific and Canadian Northern railways, near the international boundary line at an altitude of 3,461 feet. It is the receiving and distributing centre for one of the richest gold mining districts of British Columbia. Silver and copper are also found, and great smelters and reducing works have been erected here and at Trail, about 10 miles distant. Pop. 3,000.

ROSTAND, rō'stān, Edmond, French poet and playwright: b. Marseilles, 1 April 1868; d. 2 Dec. 1918. He obtained his education at the Marseilles Lycée and the Collège Stanislas of Paris, and in 1891 was admitted to the practice of law. He first came into prominence as an author in 1888, when his 'Le gant rouge,' a vaudeville sketch, was produced in Paris. About that time a small volume of poems, entitled 'Les Musardises,' appeared, but attracted scant notice; nor was 'Pour la Grèce' (1897), a poem which he recited for the benefit of wounded Greeks and Cretans in the Græco-Turkish War, much more successful. As a playwright, however, he at once met favor. His 'Les romanesques' (1894), 'La Princesse lointaine' (1895) and 'La Samaritaine' (1897), all in verse, were applauded by public and press. But they were quite outdone by his 'Cyrano de Bergerac' (1897), a five-act drama in verse, which proved to be one of the most conspicuous successes of the modern stage, being presented in Paris 500 times consecutively, with Coquelin in the title-rôle. It was given also in the United States in English by Richard Mansfield and in French by Coquelin. It employs the historic figure of de Bergerac, duelist and author. 'L'Aiglon' (1900), based on the story of the king of Rome, was given in the United States by Sarah Bernhardt, who created the part in

Paris, and in English by Maude Adams. M. Rostand was at the height of his popularity when 'Chantecler' was produced in Paris in 1910. Seats sold for \$50 and the American rights for its presentation cost a fortune. 'Chantecler' originally had been written for the French actor, M. Coquelin, who died before rehearsals and the title-rôle was then given to Guitry. The play was not a conspicuous success and its presentation in English with Maude Adams in the title-rôle was even less successful.

M. Rostand had been made a member of the French Academy, 30 May 1901, the youngest "Immortal" ever admitted; he was raised to the rank of Commander of the Legion of Honor, received a grand diploma for writing 'Chantecler' and was lionized at many brilliant assemblages. Other poems and plays by M. Rostand were 'Le pois sacré'; 'Don Juan'; 'La Cantique de l'aile' (1911); 'Le printemps de l'aile' (1912); 'La Belgique,' and 'The Song of the Stars.' Rostand's versification is finished and brilliant, his wit keen and polished and, added to these, his work displays a certain enthusiasm and spontaneity. He contributed, with Stephen Phillips (q.v.), to the much-talked-of renaissance of the poetic drama.

Early after the outbreak of the War of the Nations in 1914 M. Rostand volunteered to fight as a French soldier, but his services were declined. He proceeded to hearten the Entente Allies, however, by writing patriotic verse, and one poem, in which he praised America's attitude, was dedicated to Sarah Bernhardt. When the *Lusitania* was sunk, M. Rostand wrote a long poem excoriating Count von Bernstorff, German Ambassador to the United States, and accusing him of perfidy.

Rostand married early in life Rosamond Gérard, granddaughter of Count Etienne Gérard, a Marshal of France during the Napoleonic wars. They had one son, Maurice, who has collaborated with his mother in writing the plays 'Un bon petit diable,' produced in New York in 1913 as 'A Good Little Devil' and 'La petite vendeuse d'allumettes' (1914). Among English translations are 'Cyrano' by Thomas and Guilenard (1898) and Hall (1898); 'L'Aiglon' by Parker (1900); 'Les romanesques' by Fleming (1900), and Hendece (1899), and 'Chantecler' (1910). See **CHANTECLER**; **CYRANO DE BERGERAC**, and **L'AIGLON**.

Bibliography.—Filon, 'De Dumas à Rostand' (Paris 1898); Chesterton, G. K., 'Varied Types' (New York 1903); Hale, E. E., Jr., 'Dramatists of To-Day' (6th ed., ib. 1911); Lewisohn, Ludwig, 'The Modern Drama' (ib. 1915); *Edinburgh Review* (October 1900) and *L'Illustration* (1898, 1910).

ROSTOCK, rōs'tok, Germany, in the grand duchy of Mecklenburg-Schwerin, on the left bank of the Warnow, 80 miles northeast of Lübeck, is one of the most important cities on the Baltic. It consists of three parts: The Old, the New and the Middle Town. The east or Old Town bears the impress of an old Hanse town; the Middle Town is the most modern and best built. The most noteworthy points of interest are the palace of the grand duke; the town-house, with its seven towers; the church of Saint Mary (1400) and church of Saint Peter, with a steeple 414 feet high; the university (1419), attended by about 500 students; the

house in which Blücher was born and the one in which Grotius died; schools, hospitals, etc. The fine promenades surrounding the city were formed on the site of the old fortifications. There is an extensive trade in agricultural products and salt, and important fisheries. Pop. 65,400.

ROSTOPCHIN, rōs-tōp'chīn, or **RAS-TOPOCHIN**, Feodor Vassilievich, Count, Russian general: b. province of Orel, 23 March 1763; d. Moscow, 12 Feb. 1826. He entered the Imperial Guards as lieutenant, was highly promoted under Paul I, but afterward dismissed in disgrace. Under Alexander he became governor of Moscow and exercised an important influence over the campaign of 1812, even if the assertion of the French that the burning of the city was his work should be untrue. He himself denied this charge in his 'Vérité sur l'incendie de Moscou' (1824). It is certain, however, that he caused his villa near Moscow to be burned and took measures for the destruction of the magazines in that city. In 1814 he accompanied the Emperor Alexander to the Congress of Vienna. He afterward traveled and spent several years in literary pursuits in Paris. His works include a number of historical memoirs, comedies, etc., written in French and Russian and published in 1853. Consult Schnitzler, 'Rostopchine et Koutousoff'; Segur, 'Vie de Comte Rostopchine.'

ROSTOV, rōs'tōf, or **ROSTOFF**, Russia, in the government of Ekaterinoslav, picturesquely situated on a prominent summit above the Don, 20 miles from its mouth in the Sea of Azov. It is the oldest town of eastern Russia, a centre of considerable traffic and some domestic industries, and its annual fair establishes the prices of cotton goods preliminary to the great fair of Nijni-Novgorod. The chief objects of trade are grain (the principal article of export), flour, tobacco, drugs, herbs, saddlery, linen manufactures and enameled sacred pictures. It has ever counted as an important point, from the period when it was first contended for by Slavs and Finns. After the Mongolian invasion it declined and was successively plundered by Tartars, Lithuanians and Poles. Electric lighting, street railroads and telephones are among its modern features. The ancient cathedral (1216) contains precious sacred relics of Christian missionaries and princes. Pop. 121,300.

ROSTRA, a name given the platform or stage in the forum in Rome, whence the orators used to harange the people, so called from the beaks (*rostra*) of the ships taken, in 338 B.C., from the Antiates, with which it was adorned. It was a circular structure raised on arches, with a stand on the top, bordered by a parapet, the access to it being by two flights of steps.

ROSWELL, rōz'wēl, N. Mex., city and county-seat of Charles County, on the Rio Hondo, a tributary of the Pecos River, 150 miles southeast of Albuquerque, on the Atchison, Topeka and Santa Fé Railroad. The New Mexico Military Institute is located here; there are flour mills, and the city is the centre of rich cattle, sheep and farming country. It was incorporated as a city in 1904 and is growing steadily. Pop. (1900) 2,006; (1910) 6,172.

ROSWITHA, rōs'vē-tā, or **HROTS-WITHA**, hrōts'vē-tā, German poet: b. about 932; d. about 1002. She was of Saxon birth and a nun in the Benedictine convent of Gandersheim, Brunswick; the first German poet and the first dramatist since the Roman period. She wrote sacred legends, a poetical chronicle of the reign of Otto I and six Latin comedies for performance before the sisterhood. The latter were imitations of Terence, and without attempting a development of character they displayed rapidity of action and good theatric effect. Her works were first published at Nuremberg in 1501; translations were made by Benedixen in 1850-53. The best edition was published by Barack in 1858. Consult Köpke, 'Hrotsuit von Gandersheim' (1869).

ROSY FINCH, one of the large finches of the genus *Leucosticte*, native to the northern parts of Asia and northwest America. Several species inhabit the higher parts of the Rocky Mountains and the colder parts of northwestern America, coming southward in winter. Their plumage is suffused with rose-red, brightest in the males, and in the spring they have a loud and pleasant song. The best-known species is *L. tephrocotis*, common in Colorado and Utah in winter. Consult Coues, 'Birds of the Northwest' (1874).

ROT, a disease in sheep and other gram-inivorous animals, produced by the hydatids *Fasciola hepatica* and *Distoma lanceolatum*, often living in great numbers in the gall-ducts and bladder of the animal. (See SHEEP). Also the popular name for many fungoid diseases of plants. See DISEASES OF PLANTS; FUNGI.

ROTA ROMANA, rō'tā rō-mā'nā, or **RUOTA ROMANA**, signifies an ecclesiastical tribune of the Roman Catholic Church situated at the papal court; from this situation probably comes the name of the tribunal, since the old papal courts were decorated with mosaics in the shape of wheels or *rotæ*. The Rota Romana was at one time a body of vast judicial power, having jurisdiction not only over all cases of appeal and all disputes of beneficiary and patrimonial nature, but as well over the more important class of all cases concerning ecclesiastical benefices. These last are no longer within the jurisdiction of the court, its power being diminished of necessity by the political position of the papacy of to-day. But over the first two classes named the court has full jurisdiction, its decree being final, inasmuch as the only appeal permitted is one directly to the Pope.

The Rota Romana was, and still is, a collegiate body, although its constitution has undergone radical changes in recent years. Originally it was composed of 12 prelates, mostly Italians, but representing also the other papal states of Catholic Christendom. The meetings which took place in the palace of the Pope twice a week were of supreme importance in the administration of the Roman Catholic Church law throughout the world. The Tribuna is now divided into two colleges or senates.

ROTARY STEAM ENGINE, a type of engines in which the pistons rotate within the cylinder, or the cylinder upon the pistons, thus giving a continuous rotary motion and eliminat-

ing the loss of power consequent to the necessary change in the direction of motion of a piston working horizontally in a cylinder, as in the case of an engine operating with a reciprocating action.

The varieties of rotary engines are numerous, consisting of machines equipped with one, two, three and four pistons on single axes, or of pistons working in pairs on several axes, operated by steam injected against them, or working by the reactive action of steam emitted tangentially. The basic principle was suggested by the inventors of the last century, among whom Watt, Cartwright and Galloway may be included; while among the notable engines of this class may be mentioned the Scheutz (Swedish), the Thompson (Scotch), the Behrens (American) and the Pillens and Hill (English), in all of which the pistons revolve within the cylinder and differ from each other only in the details of the mechanical arrangements employed to utilize the pressure of the steam.

In another form perfected by Harris, portions of the engine are attached to two hubs and run in different directions. The hollow trunnions of one axis carries the two radial arms which emit steam at their ends tangentially against vanes carried on the other axis with a direct driving action. By gearing the two motions are utilized upon a single shaft. The latest development, and perhaps the most efficient, is that perfected by William M. Hoffman, of the type in which the cylinder revolves around the pistons upon an elliptical steam-chest supported by a hollow shaft through which the steam is admitted and exhausted.

FIG. 1. Standard for holding stationary shaft and core.

Fig. 1 shows a side view of the Hoffman engine in which the shaft and core, or steam chest, are stationary and the cylinder revolves. Live steam is admitted at the left end of the hollow shaft and is utilized by the action of an automatic cut-off arrangement which allows it to enter the expansion chamber from the stationary core, where it expands and pressing against a piston moves it forward over the elliptical surface of the core and in so doing causes the cylinder to revolve. As the piston approaches the greater dimension of the ellipse, it is forced into its housing, where it forms an abutment against the escape of steam; while a piston in its housing on the opposite side of the cylinder arrives opposite the port of exhaust exhausts the steam, and, relieved of the pressure of the greater dimension of the ellipse, emerges from its housing, and forms the free side of a new chamber, into which the live steam is again admitted by the automatic cut-off to expand and continue the action while steam is admitted to the shaft. The expansion

chamber is so arranged that it has but three sides—the inner surface of the cylinder and the outer surface of the ellipse, both of which are rigid, and the convex surface of the pistons, which are free to move in and out of housings in the cylinder casing.

FIG. 2. Common efficient type of Rotary Engine.

The chief defects of this type of rotary engine are the excessive loss of power by friction of the pistons against the core and the complicated system of valves, steam ports, connecting arms, etc., which are difficult to keep in proper order. Many forms of rotary engine are entirely free from valves and steam ports. The type illustrated in Fig. 2 uses the expansion of the steam in one long curve, for almost a complete revolution of the rotor R. The pistons P slide in grooves in the rotor R and are pushed against the cylinder by helical springs. When steam is admitted it pushes the first piston ahead and with it the rotor until the next following piston is exposed to its action. Near the exhaust port the piston is pressed into its groove and as it passes the port the steam is exhausted.

Rotary engines are designed to obtain the greatest possible efficiency with the least amount of fuel consumption and a great reduction in engine-room floor space. Engines capable of developing 300 horse power at 2,000 revolutions per minute have been successfully and economically operated.

W. MOREY, JR., C.E.,
Consulting Engineer.

ROTATION, (a) in astronomy, the turning round of a planet on its imaginary axis, like that of a wheel on its axle. The rotation of the earth is performed with a uniform motion from west to east and occupies the interval in time which would elapse between the departure of a star from a certain point in the sky and its return to the same point. The only motions which interfere with its regularity are the precession of the equinoxes and nutation. The time taken for the rotation of the earth measures the length of its day. So with the other planets. The sun also rotates as is shown by the movement of spots across its disc (see SUN). The earth's rotation slightly increases the force of gravity in moving from the equator to the poles. Sir William Thomson,

reasoning from some small anomalies in the moon's motion, inferred that 10,000,000 years ago the earth rotated one-seventh faster than it does now, and that the centrifugal force then was to that now as 64 to 49; (b) in botany, the movement of the protoplasm observed in the cells of cell-walls of certain plants. Little or nothing is definitely known as to the causes that bring it about, but it is probably related to the similar motion in amoeba and other low orders of animal life; (c) in mechanics. See MECHANICS.

ROTATION OF CROPS, the order in which crops are grown during a series of years on the same land. The advantages of this practice are: (1) All plants tend to exhaust the soil, but in different degrees, hence a rotation tends to maintain a balance. Thus at the Rothamsted Experiment Station, England, where wheat has been grown on the same land for 62 successive years without manure or fertilizers, the average yield is about 13 bushels per acre, or nearly the same as the average yield in the United States, while where grown in a four-course rotation of rutabagas, barley, beans or clover, wheat, the average yield during a period of 52 years is nearly 27 bushels per acre, without manuring or fertilizing. (2) All plants do not take up the same ingredients in the same proportion; thus, crops rich in carbonaceous matter take up relatively small amounts of food from the soil, but large quantities from the air, the latter costing nothing. (3) Some crops give better opportunity for cleaning land, as corn, potatoes. Others cannot be tilled and favor the growth of weeds, as wheat, oats. (4) When several crops are grown on a farm the labor is distributed over a greater portion of the year and it is more economical. The social evils consequent on temporary employment at high wages for a short period of the year, and idleness the rest of the time, cannot be overlooked. (5) Plants vary in their ability to assimilate the plant food in the soil; thus buckwheat and rye are able to flourish where wheat and cabbages could hardly live. (6) The legumes enrich the soil in nitrogen. (7) A variety of crops is essential where cattle and other livestock are kept. (8) In a rotation the increase of destructive insects and diseases is hindered, owing to their not having the necessary crop to prey upon. (9) Some crops permit the sowing of others among them, thus saving time; clover and grass seeds being sown among barley and wheat, wheat sown among corn. (10) Some crops permit the aggregation of the soil particles when they become excessively reduced by tillage, hence land is laid down to grass, alfalfa. (11) Certain crops aid in accumulating humus, as grass, hence such should follow two or three years of exhaustion by tillage. Admitting air to the soil tends to destroy humus and to reduce the water-holding capacity. The loss of humus has converted garden-spots in New York and other Eastern States, northern Africa, Asia Minor and Spain into wastes, and Sicily, the granary of Italy in the time of the Romans, is now comparatively sterile.

Rotations are described according to the number of years required to complete a circuit, as three-course, four-course, etc. In the latter the tillable land is divided into four parts and

each crop is grown on part of the farm each year. The folly of growing the same crop on the same land for several successive years was noted by the Romans and others, as also the benefits derived from growing a leguminous crop, as alfalfa or clover, previous to a grain crop, as wheat. These observations remained unutilized until a comparatively recent date. Rotations have gradually grown into their present forms according to circumstances, and have been and are modified as required and as our knowledge increases. Attention was first drawn to their value in 1777, in a treatise by Dickson of Edinburgh, Scotland.

One of the earliest recorded systems was the "outfield" and "infield," in which part of the land was used for growing grain until its crop-producing power was so reduced that it became unprofitable, when it was allowed to lie idle for a number of years. Increase of population caused a modification, the land being rested or "fallowed" a year at intervals; thus, among the Jews, this was repeated every seventh year. A system of continuous single cropping has been pursued in the Western States with distinct loss to the nation. Where land is weedy and in dry districts, as parts of California, the east of England, etc., bare fallowing or the cultivation of the soil without growing a crop is still considered good practice, sufficient moisture being conserved to ensure a profitable crop the succeeding year. A development from this system consisted of the introduction of green crops, either intertillage crops, as corn, turnips, potatoes, cabbages, etc., if the land was weedy and needed cleaning, or of legumes, as clover. The advantages of a crop-fallow are that the land is turned to profitable use; it is cleaned and the available nitrogen present as nitrates is not so liable to be lost by percolation, being taken up by the crops; that humus is produced from the root-residue; and that if a leguminous crop is grown it enriches the soil in nitrogen by means of the bacteria on its roots.

In 1788 Marshall of England stated that a common rotation was: 1st year, wheat, barley or bigg; 2d year, oats, beans and pulse; 3d year, bare fallow. A distinct advance was made with the realization of the value of the Norfolk four-course, which was practised on light land and originally consisted of roots, barley, clover, wheat. The principles involved are (1), that a deep-rooted crop shall succeed a shallow-rooted one, barley being shallow-rooted and clover deep-rooted; (2) that crops of the same natural order and somewhat like tendencies, as wheat and barley, both being straw-crops and more or less subject to similar enemies, shall not succeed each other; (3) that a weedy crop shall be followed by a cleaning one, as the roots after the wheat; and (4) that a leguminous crop shall have a place in each rotation. The advantages of this system were: (1) The wheat was grown after a nitrogen-gathering crop; the clover stubble was readily prepared for wheat in the fall, or if stock feed was scarce it could be pastured late and spring wheat or oats grown instead. The wheat was harvested in time to permit the land being fallowed and cleaned for the succeeding root crop. (2) The fallow crop, roots, received manure and intertillage, and gave an opportunity to clean the land and stir it deeply. It furnished work for the horses in summer in

cultivating, and a bulky crop of succulent feed for stock, which with the hay furnished considerable manure. (3) A grain-crop follows well after a root crop, and generally little or no plowing is needed. Barley is a good crop to seed with, as it occupies the land but a short time and is not so exacting on the soil moisture as oats. (4) The clover requires a firm seed-bed, and if the roots were consumed on the land and shallow tillage given in fitting the land for the barley, such was secured. The barley permitted a good growth of clover which enabled it to withstand the winter. This crop supplied the hay. The disadvantages of this system are that it is too short, the land being liable to become both clover and turnip sick, and the turnips affected with "club-root." Under these circumstances clover and turnips could be taken every eighth year, substituting beans, peas or cowpeas for the former, and potatoes, etc., for the latter. Such close cropping renders the rotation expensive, the labor bill being high, but the cost may be reduced by leaving the grass and clover seeding down for two or three years, thus making a five or six years' rotation, or it may be used as the basis for a seven or eight course. This rotation is capable of adaptations as follows: (1) Grain—wheat, oats, barley, rye, corn, buckwheat; (2) cleaning or fallow crop—corn, potatoes, sugar beets, mangels, tobacco, cabbages, turnips, rutabagas, rape, cowpeas, soy beans, sorghum, etc.; (3) Grain—barley, oats, rye, wheat, corn; (4) Legume—clover, grass and clover, cowpeas, soy beans; (5) Legume—grass and clover, mown once and pastured, or pastured all the year.

In the United States the rotations of crops vary considerably in different sections. In many places the succession of crops is dictated rather by accident or convenience than by any well-considered principles. Corn and wheat or oats formed a common two-course rotation with the early settlers, until the land failed to produce a crop of wheat when corn was grown every second year, the land going to weeds in the interval. The "Eastern Shore rotation," which is a two-course, consists of corn followed by oats, with a secondary crop of Magothy Bay beans. The growth of this leguminous crop, while curtailing the yield of oats, furnishes considerable green manure for plowing in. The first system on the best cultivated farms in Virginia was a three-course, beginning with corn, and succeeded by wheat in which the grass and weeds were allowed to grow and be grazed the third year. One well-known farmer in Virginia grew clover in place of the weeds the third year to furnish green manure. A later rotation was: (1) corn or oats; (2) wheat and clover sown; (3) clover grown and plowed under in August, and the land seeded to wheat for the fourth year.

An old and successful rotation recorded for New England is corn, oats and timothy and clover, the latter remaining down for three years; thus two plowings are required in five years, one for corn, and a light plowing for oats, the grass and clover seed being sown among the oats. A modern three-course rotation for the Eastern States is potatoes, winter rye, clover. This is a modification of a well-known Middle Western rotation, pota-

atoes, winter wheat, clover. It embraces a root crop, a cereal and a leguminous crop. It is well suited to light and medium soils and is economical in labor, but one deep plowing being required in three years, that for the potatoes, the land being prepared for the rye by discing. The potatoes are a cash crop, the rye furnishes bedding and feed for stock, and the clover furnishes hay, and is not left down long enough to be seriously injured by the clover-root worm. The rotation is too short for many places, and probably the land would become clover-sick. It may be converted into a four-course by growing a crop of corn after the clover, and into a five-course by sowing grass with the clover and leaving them down for two years, thus corn, potatoes, rye, grass (timothy, redtop, etc. clover), mown, grass mown and grazed. In this way two-fifths of the tilled land is plowed each year, that for corn and potatoes; the land for potatoes may be plowed in fall after the rye is sown in September, thus reducing the spring work. If milch cows are kept, the corn furnishes grain and stover or may be cut for silage, the rye may be cut green for fodder or allowed to mature, and the area in potatoes might be reduced and cowpeas, soy beans, peas and barley, or some other fodder or silage crop substituted.

For a dairy farm having half the land in permanent pasture, a satisfactory four-course is (1) corn (cut for silage); (2) oats, the land being fall-plowed, the crop furnishing grain and bedding; (3) wheat (sown in fall, the grain being sold or consumed, the straw used for bedding); (4) clover (sown in spring in the wheat). This rotation permits of carrying the maximum amount of livestock and having a large supply of manure, thus enabling the crop-producing power of the soil to be maintained or increased. The livestock furnish constant employment and enable the farmer to make two profits, that of the grower and the manufacturer.

A common rotation in the Middle West is corn, wheat and clover. The wheat is sown in the corn with a one-horse drill before the latter is mature, the clover being sown in the wheat. Labor is a serious problem, and this system economizes it, but one plowing being required. Consult Wheeler, 'A Rotation of Crops,' Bull. 74, 75, 76, Agr. Exp. Sta., Rhode Island (1900); Gilbert, 'Memoranda of the Rothamsted Experiments' (1901); Parker, E. C., 'Field Management and Crop Rotation' (Saint Paul 1915). Consult also works referred to in article AGRICULTURE IN THE UNITED STATES, all of which emphasize the imperative necessity of rotation if our lands are to be saved from exhaustion.

ROTCH, röch, Abbott Laurence, American meteorologist: b. Boston, Mass., 6 Jan. 1861; d. 5 April 1912. He was graduated from the Massachusetts Institute of Technology in 1884, and in the following year established and afterward maintained at his own expense a meteorological observatory at Milton, Mass. On 14 Dec. 1906 he was appointed professor of meteorology at Harvard University. He was the first meteorologist in the United States to measure the height and velocity of clouds, and to use kites with a self-recording instrument for this purpose. He also made experiments

in wireless telegraphy. He was the author of 'Sounding of the Ocean of Air' (1900); 'The Conquest of the Air' (1909).

ROTH, rôt, **Frederick George Richard**, American sculptor: b. Brooklyn, N. Y., 28 April 1872. He received his early education in Germany and studied art at the Vienna and Berlin Academies of Fine Arts. He returned to the United States and from 1890 was professionally engaged as a sculptor, attaining a reputation for the excellence of his small animal groups. He has exhibited in New York, Philadelphia, Saint Louis, Chicago, Portland and Düsseldorf; and was awarded silver medals at the Saint Louis and Buenos Aires expositions, and a gold medal at Panama. He was elected to the National Academy in 1906. Five of his small bronzes are in the Metropolitan Museum of Art.

ROTHERHAM, rōth'ér-əm, England, county borough in the West Riding of Yorkshire, at the confluence of the Rother and the Don, five miles northeast of Sheffield. The most notable buildings are the 14th century cruciform church, market hall, post office, courthouse, corporation buildings, mechanics' institute and free library.. The town possesses extensive metal and railway carriage works, potteries, glass works and rope yards. It is of Roman origin and was of some importance in the Anglo Saxon period. Pop. 62,500.

ROTHERMEL, rōth'ér-mél, **Peter Frederick**, American painter: b. Luzerne County, Pa., 18 July 1817; d. near Pottstown, Pa., 15 Aug. 1895. He was educated as a land surveyor, but at 22 studied painting, and about 1840 opened a studio as a portrait painter at Philadelphia, and eventually turned his attention to historical subjects. Among his earlier works are 'Christabel' and 'Katherine and Petruccio.' He has also painted many American subjects, among them 'De Soto Discovering the Mississippi,' 'Columbus Before Isabella the Catholic,' the 'Noche Triste' from Prescott's 'Conquest of Mexico'; 'Patrick Henry Before the Virginia House of Burgesses'; and 'The Battle of Gettysburg.' His pictures reveal a fine sense of color and a power of dramatic composition which are not common; but he has a tendency to exaggeration and his overtrained action is very often less genuinely effective than sensational.

ROTHROCK, **Joseph Trimble**, American botanist: b. McVeyton, Pa., 9 April 1839. He was graduated at Harvard in 1864, and took his M.D. at the University of Pennsylvania in 1867. He served in the Civil War and was wounded at Fredericksburg. He was professor of botany at the University of Pennsylvania in 1877-93; commissioner of forestry for Pennsylvania in 1893-1905; and in 1905-08 he was superintendent of the State Sanatorium for Consumptives, South Mountain Camp. Author of 'Flora of Alaska' (1867); 'Botany of the Wheeler Expedition' (1878); 'Vacation Cruisings' (1884); 'Pennsylvania Forest Reports' (1895-97), etc.

ROTHSCHILD, rōths'child (Ger. rōt-shilt). The famous European financial house known as Rothschild was founded by Mayer Anselm Rothschild: b. Frankfort-on-the-Main 1743; d. 19 Sept. 1812. He was of Jewish

parentage, and was destined for the priesthood, but found commercial pursuits more to his liking, and engaged in trading, afterward entered a banking house in Hanover. His industry, frugality and sound business methods made him in a few years the master of a small capital, and he returned to Frankfort, where he established the banking house still in existence. The firm originally consisted of his five sons, who established branches of the house in different European cities: Anselm, b. 12 June 1773; d. 6 Dec. 1855; resided in Frankfort; Solomon, b. 9 Sept. 1774; d. 27 July 1855; lived in Vienna; Nathan, b. 16 Sept. 1777; d. 18 July 1836; located at London; Karl (baron), b. 24 April 1788; d. 10 March 1855; resided in Naples; and Jacob (baron), b. 15 May 1792; d. 15 Nov. 1868; resided in Paris. The political events of 1813 raised the house of Rothschild to the important position it has since occupied in the commercial and financial world. In 12 years the Rothschilds raised by way of loan or subsidy an amount exceeding £100,000,000 sterling which was distributed by them in nearly the following proportions: England, £40,000,000; Austria, £10,000,000; Prussia, £8,000,000; France, £16,000,000; Naples, £10,000,000; Russia, £5,000,000; several German courts, £1,000,000; Brazil, £2,000,000; exclusive of various other large sums. The remarkable degree of success attained by the house, setting aside the favorable circumstances of which they have taken advantage, may be largely attributed to their strict adherence to two fundamental maxims laid down by the founder of the house. The first of these is their conducting all operations in common. Every proposition of magnitude is laid before each member of the firm, fully discussed and then executed by their united efforts. The second principle is to set definite limits to each operation and never to aim at exorbitant profits. Their wealth has increased in an unexampled degree, and their reputation and credit have been steadily fortified by fair dealing, reasonable terms and sagacious and systematic operations which are clearly planned and judiciously executed. The Rothschilds are extremely punctual in meeting their contracts, and before the introduction of the telegraph their couriers were frequently in advance of the government. The advantages of their system and their strength were clearly shown when in 1848 they met conjointly a loss of several millions, which would have crushed any other house, but which the enormous scope of their resources enabled them to meet without difficulty. The members of each succeeding generation are admitted into the firm and much intermarriage among cousins indicates that the family is destined long to retain its control of European finance. Lionel Nathan, b. 22 Nov. 1808; d. 3 June 1879, was the first Jew admitted to the English Parliament, and his son Nathaniel Mayer, b. 8 Nov. 1840; d. 13 June 1905, was created a baron in 1883, who was succeeded by his son, Lionel Maitland, b. 8 Feb. 1868, as second baron Rothschild. Consult Reeves, 'The Rothschilds' (1887); 'Das Haus Rothschild' (1857); Von Scherb, 'Geschichte des Hauses Rothschild' (1893); Michaud et Villeneuve, 'Histoire de Saint-Simonisme et de la famille de Rothschild' (1847).

ROTHSCHILD, Alfred Charles de, English financier: b. 1842; d. February 1918. He was educated at King's College School, London, and Trinity College, Cambridge. He was a partner in the firm of N. M. Rothschild and Sons, and from 1868 to 1890 a director of the Bank of England. The last of the three brothers who had presided many years over the London branch of the family, he was the second son of the late Baron and Baroness Lionel de Rothschild, and a brother of the late Lord Rothschild. All the brothers died during the war.

ROTIFERA, a group of small, usually microscopic animals, are familiarly known as wheel animalcules, because of the presence at the anterior end of a crown of cilia which in their vibration suggest the rotation of a wheel. The opposite (posterior) end of the body is prolonged into a stalk (foot), which is the organ of attachment in sessile forms or is used in walking by such as are free. It is often segmented and may be terminated by one or two pointed toes, while a cement gland in the foot aids in fixation. The anatomy is simple and usually easily studied in the living animal. In general it recalls that of the embryonic annelid with which the rotifers are often genetically connected (see *TROCHELMINTHES*). A vascular system is wanting and the excretory system consists of "flame-cells." The sexes are separate, but the males are rare, degenerate and needed only for the production of the fertilized winter eggs. Summer eggs develop parthenogenetically. The rotifers are abundant and widely distributed, but confined almost entirely to fresh water. They were among the very first of microscopic organisms to receive attention, and have always been favorite objects of study. A few forms are parasitic in habit and almost all are capable of desiccation and subsequent revival.

ROTOGRAVURE, a process used in reproducing photographic illustrations by means of engraved cylinders, the machine printing both sides of the sheet, illustrations and printing, at the same time. The paper is fed from rolls and the machine delivers it printed, dried and cut into sheets. The process is invaluable because of the rapidity and low cost with which perfect work may be produced, and makes possible the elaborate illustrated supplements of newspapers and magazines. The reproductions are exact and the costly "make-ready" work required with flat plates is eliminated. The principle of the machinery is the same as in that used for wall-paper printing and silk printing.

ROTTECK, röt'tëk, Karl Wenceslaus Rodecker von, German historian and publicist: b. Freiburg in Baden, 18 July 1775; d. there, 26 Nov. 1840. He was educated at the University of Freiburg, early turned to the study of history and in 1798 was appointed professor of that department in Freiburg University, a chair exchanged in 1818 for that of natural and international law. In 1819 he was chosen by his university as their representative in the first chamber of the states of Baden, and there proved an ardent champion of political reform. He was one of the founders of *Der Freisinnige*, a journal with strong democratic leanings, and brought upon himself the displeasure

of the Conservative party, who compelled him to resign his professorship and discontinue the editing of all public prints for five years. An ineffectual attempt was made to exclude him from the second chamber of the states, to which he had been elected representative in 1830; but he continued to hold this seat till his death. His chief work is 'Allgemeine Weltgeschichte' (1813-27). Numerous translations of the original work, or an abridgment published by Rotteck, entitled 'Auszug aus der Weltgeschichte,' have appeared in most European languages. It is a critical narrative of prominent events written from a liberal point of view. Other works are 'Lehrbuch des Vernunftrechts und der Staatswissenschaften' (1829-30); 'Lehrbuch der ökonomischen Politik' (1835); 'Kleinere Schriften' (1829-30); and, with Welcker, a 'Staatslexikon' (1834-44).

ROTTENSTONE, a decomposed mineral substance, consisting chiefly of alumina with about one-ninth of carbon and half as much of silica. It is supposed to be formed almost wholly by decomposition of shale, and is chiefly found in Derbyshire, England, in South Wales, and near Albany, N. Y. It is either grayish, blackish or reddish-brown in color, is soft and easily scraped to powder and is much used for cleaning and polishing metallic surfaces, glass, etc. The term rottenstone is now used to include the tripoli of commerce (first imported from Tripoli, Africa), and also any kind of silicious material suitable for the same purposes.

ROTTERDAM, röt'er-däm (Dutch, röt-tër-däm'), Netherlands, one of the chief cities and busiest ports of the country, 36 miles by rail southwest of Amsterdam. Important waterways connect the town with the sea and with the interior. Thus vessels of deep draft may approach quite near, and the amount of tonnage entering Rotterdam (including that which is connected with the inland traffic) is only surpassed by London among European ports. The Hoog Straat, built on the protecting dike, divides the city into Binnenstad and Buitenstad. The intersecting canals cut the Buitenstad into islands. The canals or "havens" are Rotterdam's streets, generally speaking, and the principal buildings line the main "havens." In the Groote Markt is a statue to Erasmus, who was a native of Rotterdam. Saint Lawrence Church, founded in 1414, contains an excellent organ and some fine marble monuments to celebrities. There is an academy of fine arts, various museums and schools of navigation, music and technology. There are also zoological gardens and a public park. The modern public buildings form a remarkable contrast to the quaint old-time wooden gabled houses. Rotterdam carries on an active foreign and domestic trade with her colonies, Europe and America. The imports include native produce from her eastern and western colonies, and grain, coal, oil, seeds, etc. The exports are linen, flax, dairy products, gin and manufactures. Rotterdam boasts many flourishing mills, shipbuilding yards, ironworks and distilleries. Pop. 417,800.

ROTTI, röt'të, ROTTEE, or ROTTO, an island belonging to the Netherlands, in the Indian Ocean, northwest of Australia and southwest of Timor Island. It is of volcanic origin; its greatest length is 36 miles, and greatest

width 11 miles; area, 655 square miles. The surface is nowhere above 800 feet high. It has a bold, rocky coast; the surface of the interior is undulating and the soil is very fertile. The lontar, or palmyra palm, furnishes a juice which is one of the principal articles of food. Maize, rice, millet, cotton and tropical fruits are plentiful, and cabinet woods are exported. Horses, goats, sheep, pigs and buffaloes abound. Edible birds' nests and wax are also exported. The natives, supposed to have come originally from Java, are a fine-looking race. Pop. 80,000.

ROTTMANN, rôt'män, Carl, German painter: b. Handschuchsheim, near Heindelberg, 11 Jan. 1792; d. Munich, 6 July 1850. He early established himself at Munich, but finding little congeniality in the studies of the academy, interested himself in the natural scenery of the country, which formed the environs of the city, and by his independent studies he actually instituted a new school of German landscape. His masterly pictures attracted the attention of King Louis, who engaged him to paint a series of Italian landscapes; and his frescoes, executed between 1829 and 1833 in the arcades of the palace gardens, are remarkable for color and masterly power in line. Among his oil paintings may be mentioned 'The Acropolis of Sicyon' and his 'View of Corfu,' now at Munich in the new picture gallery; 'The Fountain of Callirrhoe,' at Munich; 'Perugia' in the National Gallery at Berlin. While he was a powerful and imaginative painter in oil, his chief claims to recognition in modern art history are his mastery of water colors and his skill in genuine naturalism.

ROUBAIX, roo-bä, France, in the department of Nord, six miles northeast of Lille, is a prosperous manufacturing town, containing many mills and factories, dye works and tanneries. Its public buildings are unimportant. Its woolen and linen manufactures and its carpets are celebrated. Pop. 122,700.

ROUBILLAC, roo-bē-yäk, Louis François, French sculptor: b. Lyons, about 1695; d. London, 11 Jan. 1762. He settled in England about 1720, and a monument designed by him for the Duke of Argyle in Westminster Abbey brought him into great repute. Among his monumental works are statues of Bishop Hough in Worcester Cathedral; of Sir Peter Warren; of Handel in Westminster Abbey; of Shakespeare in the British Museum, and of Sir Isaac Newton at Cambridge.

ROUCOUYENNE, roo'koo'yén', or **ROUCOUENNES**, a South American Indian tribe of Cariban stock, living in French Guiana around the upper waters of Maroni River. They take their name from *roucou*, the French name for a vegetable with the juices of which they paint their skins. They are thought to be remnants of the true Caribs, or Galibis, who have taken refuge in the interior in order to lead their lives according to their own customs. They are said to permit the marriage of father and daughter and brother and sister. Consult Brinton, D. G., 'The American Race' (1891).

ROUEN, roo-än, France, chief town of the department of Seine-Inférieure, situated on the right bank of the Seine, 87 miles southwest of Paris, ranks next to Lyons as a manufacturing

city, and is one of the most attractive provincial towns of the republic. Rouen possesses much interest in its public buildings, many of which are almost perfect specimens of Gothic architecture. They include the venerable cathedral of Notre Dame, the product of centuries of construction; begun in 1220 under Philippe Auguste, it has seen many vicissitudes, but its imposing façade surmounted by lofty towers, its richly decorated walls, its exquisite wood carvings, fine sculpture and beautiful rose-windows render Notre Dame one of the most remarkable and artistic of Christian temples. Among others are the abbey and church of Saint Ouen, also in the Gothic style, whose aerial tower terminates in a crown of fleurs-de-lis; the church of Saint Maclou, a fine specimen of florid Gothic; the Tour de la Grosse-Horloge; the Palais de Justice, of the 15th century, remarkable for the delicacy and boldness of its construction; the Hotel de Bourghéroutle (15th century), with fine reliefs; the archiepiscopal palace; the musée or picture gallery, containing a fine collection of paintings by French masters, and the ancient Halles or market buildings. There is a large library and several museums of scientific collections. In the Place de la Pucelle Joan d'Arc was burnt. Rouen is the birthplace of Corneille, Fontenelle, Boieldieu and Flaubert. It is the seat of an archbishop and seat of law courts, and possesses a chamber of commerce, an exchange, mint and schools of science, art and the higher professions. The staple manufacture is cottons, in every form, one class of which is so specialized as to be known as *rouenneries*. Besides woolen goods, machinery, chemicals, etc., there are numerous industrial works for weaving, refining and smelting. The location of the city favors trade. The main articles are corn, flour, wool, cotton, coal, petroleum, wine, brandy, colonial produce and manufactured goods. Rouen was built before the conquest of Gaul by the Romans. It was captured and pillaged by the Normans in the 9th century. Afterward it was long held by the English until 1449. Pop. 125,000.

ROUGÉ, roo'zhä, Oliver Charles Camille Emmanuel, VICOMTE DE, French Egyptologist: b. Paris, 11 April 1811; d. Bois-Dauphin, Sarthe, 27 Dec. 1872. He was educated at the Collège de Saint-Acheul and afterward devoted himself to the study of Egyptology, early gaining a reputation as an authority. He became conservator of the Egyptian Museum at the Louvre in 1849, and professor of Egyptian archaeology at the Collège de France in 1860. He made important advances in the translation of Egyptian hieroglyphics, discovering the prototypes of the Semitic alphabet in the early Egyptian hieratic; and made other valuable contributions to the knowledge of early Egyptian history and religion, as well as formulating an improved system for the study of Egyptian grammar. Author of 'Examen de l'ouvrage du chevalier de Bunsen: Le placc de l'Egypte dans l'histoire du monde' (1846-47); 'Mémoire sur l'inscription du tombeau d'Ahmès' (1851); 'Rituel Funeraire des anciens Egyptiens' (1861-63); 'Memoire sur l'origine Egyptienne de la alphabet Phenicien' (1874); 'Chrestomathie Egyptienne' (4 vols., 1867-76); 'In-

scriptions hieroglyphiques copiées en Egypte' (1877-79), etc.

ROUGE, roozh, a cosmetic prepared and used to impart artificial bloom to the cheeks or lips. It is applied by means of a camel's hair pencil, puff-powder or a hare's foot. When rouge is properly prepared, it is said that its application does not injure the skin. Jeweler's rouge is an impalpable preparation of oxide of iron obtained by heating the yellow oxalate of iron till it decomposes, carbonic acid escaping, and only a red powder being left. It is used for polishing silver and for this purpose should be of the finest quality.

ROUGE ET NOIR, roozh ā nwör, or **TRENTE ET QUARANTE**, trönt ā kā-rānt, a modern game of chance played with the cards belonging to six complete packs. The punters or players stake upon any of the four chances: *rouge*, *noir*, *couleur* and *inverse*. The banker then deals a row of cards for noir, until the exposed pips number between 30 and 40 (court-cards count 10, aces 1), and a similar row for rouge. That row wins which most nearly approaches the number 31, and players staking on the winning color receive their stake doubled. *Couleur* wins if the first card turned up in the deal is of the winning color; in the contrary case *inverse* wins. When the number of pips in both rows are equal it is a *refait*, and a fresh deal is made; but if both happen to count exactly 31 it is a *refait de trente-et-un*, and the banker claims one-half of all stakes. This last condition places the banker at an advantage calculated to be equal to about 1¼ per cent on all sums staked.

ROUGET, Georges, zhörzh roo-zhā, French painter: b. Paris, 2 May 1784; d. there, 9 April 1869. He studied at the École des Beaux Arts and later under David, who employed him to finish many of his pictures. He became in consequence an imitator of that master. He painted a large number of portraits, those of Louis XVIII and of Charles X being noteworthy and historical subjects. Of the latter are 'French Princes Paying Homage at the Cradle of the King of Rome' (1812); 'Death of Saint Louis' (1817), at Versailles; '(Edipus and Antigone)' (1819), at Rouen; 'Francis I Pardoning Rebels of La Rochelle' (1822); 'Marriage of Napoleon and Marie Louise' (1837); 'Napoleon Receiving the Decree of the Senate Proclaiming Him Emperor' (1838); 'Death of Napoleon' (1846). Several of the churches of Paris contain religious subjects painted by him, but the major part of his work may be seen at the Versailles Museum.

ROUGET DE LISLE, roo-zhā dē lēl, **Claude Joseph**, French song-writer: b. Lons-le-Saunier, France, 10 May 1760; d. Choisy-le-Roi, 27 June 1836. He published 'Fifty French Songs, Words of Various Authors, Set to Music by Rouget de Lisle' (1826), etc., but is chiefly remembered as the author of both the words and music of 'the Marseillaise' (q.v.).

ROUGH-LEG, a buzzard-hawk of the genus *Archibuteo*, especially *A. lagopus*, so called because feathered down to the toes. It is known throughout the northern regions of both continents, and is typically whitish, streaked with rust-red, but the American form best known is a melanotic variety (*A. lagopus*

sancti-johannis), which frequents the maritime districts of the Atlantic Coast and is less often seen in the interior, except northerly. The western United States and Pacific Coast have a second species (*A. ferrugineus*), called in California squirrel-hawk, which is rusty brown, marked with gray, white and black, or sometimes plain dark chocolate brown. These hawks are large (23 to 24 inches in length) and of fierce and noble appearance, but they have none of the dash and spirit of the falcons and indeed seem inferior to the buteos in this respect. Their quarry, though diversified, is always humble; they prey upon various field-mice and other very small quadrupeds, lizards and frogs and even insects, rarely attacking birds of any kind, and then only the most defenseless. Open fields, especially in the vicinity of water, are their favorite resorts. They appear heavy and indisposed to active exertion; flying slowly and heavily and often remaining long motionless on their perch. They show some analogy to the owls in points of structure, as well as in their partially nocturnal habits. Wilson observes that it habitually courses over the meadows long after the sun has set, and Audubon calls it the most nocturnal of our species. The nest is ordinarily built of sticks, etc., in a high tree; sometimes, however, on cliffs. The eggs, three or four in number, measure about two and one-third by one and three-quarter inches, largely blotched with different shades of brown, sometimes mixed with purplish slate markings.

ROUGH AND READY, a popular nickname applied to President Zachary Taylor during the Mexican War.

ROUGH RIDERS, a name borne by the First Regiment of United States cavalry and also by the Second United States volunteer cavalry in the Spanish-American War. The original Rough Riders were the men who carried messages through the Western States before the organization of the pony express in 1859, and the name was used by William F. Cody in his 'Wild West' show, which contained a 'Congress of the Rough Riders of the World.' The army regiments were thus named because of the great number of Western ranchmen in their ranks, and they played a prominent part in the Spanish-American War. The first regiment was organized by Leonard Wood, who was commissioned colonel, and Theodore Roosevelt became lieutenant-colonel. Before the disbanding of the regiment in 1898 a Rough Riders' Association was formed, to which all members of the regiment are eligible, the right of membership to descend to the eldest son. See ROOSEVELT, THEODORE; and WOOD, LEONARD.

ROUGH-WINGED SWALLOW, a small blackish migratory swallow (*Stelgidopteryx serripennis*) of the United States generally, where it nests in summer in holes in banks, in crevices of rocks, etc., and has the general habits of the bank swallow (q.v.). The genus, of which several other species are known in Central and South America, is peculiar in having the outer web of the first wing-quill converted into a series of stiff recurved hooks, which may be supposed useful in creeping into their holes and in clinging to vertical or overhanging surfaces. Considering the general likeness of the bird otherwise to the bank swallow, the fact that this species often makes its nest and lays

its pure white eggs in some cranny about a bridge or building is noteworthy. Consult Coates, 'Birds of the Colorado Valley' (1878).

ROUGON-MACQUART, roo-gōn mā-kār, *Les*, a series of 20 novels by Émile Zola, relating the history of a family under the Second Empire and published in 1871-93. The novels were intended to form a scientific study of heredity as well as a photograph of French social life. The series begins with 'La fortune des Rougons' (1871), and this was followed by 'La curée' (Rush for the Spoil: 1872); a study of the financial world of Paris at the time Haussmann laid out the boulevards); 'La conquête de Plassans' (1874); 'La ventre de Paris' (The Markets of Paris; or Fat and Thin: 1875); 'La faute de l'Abbé Mouret' (1875); 'Son excellence Eugène Rougon' (1876), a story of political life; 'L'assomoir' (Drink: 1877), a story of life among the workmen of Paris; 'Une page d'amour' (1878), a physical and psychological study of the various phases of a woman's passion; 'Nana' (1880), a study of the life of a courtesan and actress; 'Pot-Bouille' (1882), a study of the life of the bourgeoisie; 'Au bonheur des dames' (The Ladies' Paradise: 1883), a study of the mammoth department stores; 'La joie de vivre' (1884); 'Germinal' (Master and Man: 1885), a study of life in the mines; 'L'œuvre' (1886), a study of artist life; 'La terre' (1888), a study of peasant life and the greed for land; 'Le rêve' (1888); 'Le bête humaine' (1890), a study of railway life; 'L'argent' (1891), a study of stock speculation; 'La débâcle' (The Downfall: 1892), a study of the Franco-Prussian War and the Siege of Paris; 'Le Docteur Pascal' (a pitiful story of incest: 1892). In this last story Pascal Rougon collects all the data relating to his family and sums up their history.

ROUHER, Eugène, è-zhān roo-ār, French statesman: b. Riom, 30 Nov. 1814; d. Paris, 3 Feb. 1884. He studied law and practised his profession in Riom until his election to the Legislative Assembly in 1849. He became a confidant of Napoleon III and was appointed Minister of Justice. In 1863 he was made Minister of State and in 1870 became president of the Senate and chief of the Napoleonic Cabinet. In 1860 the famous treaty with England was effected largely through his instrumentality in which the free trade policy of Napoleon was inaugurated. His activity in state affairs continued until the fall of the empire, when he fled from France. In 1872 he returned as the Corsican representative in the Assembly, and remained in office until 1875. He was to the last the leader of the Bonapartists.

ROUINS, *The Forty-seven*, a popular Japanese historic-romantic drama, based on the custom of *katakiuchi* (q.v.).

ROULERS, roo-lā (Flem. *Rousselaere*), Belgium, on the Mandel, 17 miles south of Bruges. Up to the outbreak of the Great War it carried on an active industry in the manufacture of textiles and a trade in linen, chicory, etc. Pop. 25,000.

ROULETTE, roo-let', in geometry, the path of any point in a moving plane when a given curve in the latter plane rolls without sliding on a given curve in the former. See CYCLOID; TROCHOID; HYPOCYCLOID.

ROULETTE, roo-lèt, a French game of chance, in which a small ivory ball is thrown off by a revolving disc into one of 37 or 38 compartments surrounding it, and numbered from 1 to 36, with one or two zeros. Players who have staked upon the number of the compartment into which the ball falls receive 36 times their stake; less if they have staked upon more than one number. There are also other chances on which stakes may be placed.

ROUMANIA, a variant spelling of RUMANIA (q.v.).

ROUMANILLE, roo-mā-nèl-è, Joseph, modern Provençal poet: b. Saint-Remy, near Avignon 1818; d. 1891. He was the first French poet to conceive the idea of reviving, as a literary tongue, the local dialects of southeastern France. Accordingly he gathered round him an enthusiastic band of friends, and with their assistance collected materials for a grammar and lexicon and also founded a consistent system of orthography. It was in his program to produce, and favor the production of, genuine poetry, such as would speak to the hearts of the peasantry to whom the dialect was vernacular. In 1852 he edited a collection of Provençal poems by several authors under the title 'Li Provençalo.' It was mainly under his inspiration that the society of the 'Felibres' was formed, and he was the second president of its consistory. His 'Letters,' edited by Ritter, were published 1894-95, and biographies have been written by De Bouchard (1896) and Ferris (1894).

ROUND, William Marshall Fitts, American journalist and reformer: b. Pawtucket, R. I., 26 March 1845; d. Acushnet, Mass., 2 Jan. 1906. He was educated at Harvard, became a journalist, and engaged actively in prison reform. He had served as United States delegate to various European prison congresses, was director and corresponding secretary of the National Prison Association, which he reorganized, and he also organized the Burnham Industrial Farm at Canaan, N. Y. He was the originator of the 'Mill' system of awards, since adopted in many institutions both at home and abroad, and was editor of 'Lend-a-Hand Record.' He wrote 'Achshah' (1877); 'Child Marian Abroad' (1880); 'Rosecroft' (1884); 'Torn and Mended' (1885).

ROUND, a short simple musical composition, written generally for three or more voices on the same clef. Each voice takes up the melody after the first has sung the first phrase or so, the third following the second, as it followed the first, and so on, until after a certain number repetitions the signal is given to stop. It is evident that the melody must be so constructed that each phrase must harmonize with the other, so that, when all the voices are singing, a three- or four-part harmony is heard.

ROUND ROBIN, a written protest or remonstrance, signed in a circular form by several persons, so that no name shall be obliged to head the list. This method of bringing grievances to the notice of superiors was first used by French officers, whence its derivation from *rond ruban*, "round ribbon."

ROUND TABLE, *The*. See ARTHURIAN LEGENDS.

ROUND TOWERS. See **TOWER, ROUND.**

ROUNABOUT PAPERS, The, the title of a work by William Makepeace Thackeray. He became editor of the *Cornhill Magazine* in 1859 and 'The Roundabout Papers' were sketches for this periodical. They appeared simultaneously, between 1859 and 1863, with 'Lovel the Widower' and 'The Adventures of Philip,' and exemplify the author's best qualities as an essayist.

ROUNDELAY. (1) A song of any sort in which a line, refrain or idea is constantly repeated. (2) The tune of such a song. (3) A dance in a circle. (4) Specifically, a fixed verse-form, originating in France, and better known as the *rondeau* (q.v.).

ROUNDERS, a game played with a bat and a ball by two parties or sides, on a piece of ground marked off into a square or circle or pentagon, with a batter's station, and three (or more) goals or bases at equal distances. On the ball being thrown toward him the batter tries to drive it away as far as he can and run completely round the goals, or over any one of the four parts, before the ball can be thrown back to the batting station. The batter is declared out if he fails to secure a run after having had three balls, if a fielder returns the ball so as to strike him while running, or if the ball from his bat is caught in the air by one of the fielders. See **BASEBALL**.

ROUND FISH. See **WHITEFISHES.**

ROUNDWORMS, a common or semi-scientific designation for certain slender cylindrical or spindle-shaped worms mostly parasitic. The term is sometimes applied to the phylum *Nemathelminthes* (q.v.) and again restricted to the class *Nematoda* (q.v.), also called the true roundworms. Some of the species included in these subdivisions are very slender and to such the term threadworms is applied though this designation is regarded by some as equivalent to roundworms. In medical usage the term roundworm is employed to designate especially a few well-known human parasites that fall within the general group of *Nematoda*. The most famous is the stomach worm or common roundworm, *Ascaris lumbricoides*, which as the name suggests has a certain external likeness to the earthworm. It has been known since the days of Egyptian and Greek medicine as a frequent guest in the human intestine, especially in children. The parasite is 15 to 40 centimeters long by three to five millimeters thick, the male being much smaller than the female and showing two projecting spicules near the posterior end. It is distributed over the entire world, though more abundantly in the warmer regions and in the country than in colder latitudes and in the cities.

The eggs are covered with a very heavy triple shell, the outer layer being rough and mammillated. Within this the embryo may live safely for several years if no chance is offered for further development. The latter begins when the egg is taken into the stomach of the host and its introduction is due to the use of contaminated vegetables or fruits or of impure drinking water. It has been shown recently that the embryos which hatch out in the stomach penetrate to the lung of the host and after a period there return to the intestine where

they become sexually mature and the life cycle is complete. While the presence of such parasites may not be fatal, they exert a toxic influence on the host, and give rise to reflex nervous symptoms of a serious character so that prompt measures should be taken under the advice of a physician for their removal. Similar species are found in the pig, sheep, cat, dog and horse, and some of them rarely occur in man. The pinworm, *Oxyurias vermicularis*, is less frequently spoken of in medicine as a roundworm though it is a closely related member of the group of *Nematoda*. It inhabits the rectum and like *Ascaris* is most common in children. It is a much smaller worm, measuring only 3 to 12 millimeters in length. It has been known from remotest antiquity as a cosmopolitan parasite of man and is more abundant in the cities than in the country. An intense itching is induced by its presence and if large numbers are present this results in a serious inflammation which may lead to onanism or other similar disturbances. For a description of the group see *Nemathelminthes*, *Nematoda*, *Gordiacca*, *Acanthocephala*. Particular species are discussed under *Filariasis*, *Guinea-worm*, *Parasitism*, *Trichina*. For fuller data on these worms consult special works on animal parasites and parasitic diseases.

ROUP, roop, an infectious disease of the respiratory passages of poultry, resembling diphtheria in man, but of different origin. It progresses rapidly and is frequently fatal. It has a catarrhal character at its first appearance, accompanied by a cough and with a discharge from the nostrils which quickly becomes fetid. The eyes become closed and the head often swells, while cankers of a diphtheritic appearance affect the throat and mouth and may cause death by choking. The most rigid precautions in isolating diseased members of a flock should be observed and disinfection of the premises should follow. An injection of a solution of copper sulphate, one-half ounce to a quart of water, is sometimes effective as a remedy, but at times it becomes necessary to destroy a flock and start with fresh stock on thoroughly disinfected premises. Consult Salmon, 'Important Poultry Diseases' (United States Department of Agriculture, Farmers' Bulletin No. 530, 1914); Kaupp, B. F., 'Poultry Diseases and Their Treatment' (1914); Pearl, Surface and Curtis, 'Diseases of Poultry' (1915).

ROUQUETTE, roo-kèt', Adrien Emmanuel, American Roman Catholic priest and author: b. New Orleans, La., 13 Feb. 1813; d. there, 15 July 1887. He was educated in France, where he studied law, and was graduated from the University of Rennes in 1833. Returning to America he abandoned law for the priesthood and his cherished career as a missionary to the Choctaw Indians, among whom he had spent some years in his boyhood. In 1859 he established a mission in the Indian village at Bayou Lacombe, and thenceforth devoted his life to the Choctaw people, by whom he was greatly beloved. His writings include 'Les Savanes, Poésies américaines' (1841); 'Poèmes patriotiques' (1860); 'Catherine Tegchkwitha' (1873).

ROUS, or ROUSE, roos, Francia, English Puritan: b. Dittisham, Devonshire, 1579; d.

Acton, 7 Jan. 1658-59. He was educated at Oxford and at Leyden; and lived for a number of years in Cornwall, engaged in writing and theological study. He was a member of Parliament from 1625, and in 1657 was made a lord of Parliament. He was a supporter of Cromwell; and, originally a Presbyterian, became an Independent in religion. Of his extensive religious writings 'Mystical Marriage Between a Soule and Her Saviour' (1635), gives perhaps the clearest exposition of his religious beliefs. He is remembered for his 'Psalms of David in English Metre' (1643), which were authorized by Parliament for general use and are still, in a revised form, sung in Scottish Presbyterian churches.

ROUSE, William Henry Denham, British educator: b. Calcutta, India, 30 May 1863. He was educated at Doveton College, Calcutta, and at Christ College, Cambridge. He was a Fellow at Cambridge in 1888-94; master of Rugby School in 1896-1901; and since 1901 has been headmaster of Perse Grammar School, Cambridge. Since 1903 he has also been university teacher of Sanskrit. He was acting professor of Latin at the Columbia Summer School, Teacher's College, New York, in 1912. He has made frequent use of translations in his writings. Author of 'The Jataha' (under editorship of Professor Cowell, Vols. II, IV, VI, 1895, 1901, 1907); 'The Giant Crab and other Tales of Old India' (1897); 'Tales from the Isles of Greece' (1897); 'Atlas of Classical Portraits' (1898); 'A History of Rugby School' (1898); 'The Talking Thrush' (1899); 'Greek Votive Offerings' (1902); 'Jinacaritam, or Life of Buddha' (1905).

ROUSES (rows'iz) **POINT**, N. Y., village, port of entry in Clinton County; on Lake Champlain, and on the Delaware and Hudson, the Rutland and the Grand Trunk railroads; on the boundary between the United States and Canada, about 160 miles north by east of Albany and 21 miles north by east of Plattsburg. A railroad bridge about one mile in length spans the portion of the lake between the State of New York and Grand Isle, in Vermont. The village has steamer connections with the Lake Champlain ports, and by way of the lake and the Richelieu River with many places in Canada. Rouses Point receives a large part of the custom receipts of the Champlain district. Industrial activities include a large printing-house, railroad repair shops, lumber mills and machine shops. The Charbonneau Institute, a high school, public and parish schools and two public libraries are its chief buildings. Rouses Point was a noted locality in the discovery days, and at the time of the Revolution and the War of 1812. Just on the frontier, on an island, is Fort Montgomery. Pop. 1,650.

ROUSSEAU, roo-sô, **Jean Baptiste**, French poet: b. Paris, 6 April 1670; d. Brussels, 17 March 1741. In 1701 he was admitted into the Academy of Inscriptions and Belles-lettres, and his lyric compositions procured him high reputation among the French literati; but his turn for satire and his quarrelsome temper later involved him in disgrace. He was found guilty of having written libelously against La Motte and Saurin, and was exiled from France in 1712. The latter part of his life was spent in the Netherlands, where he obtained a pen-

sion from the Duke of Aremberg, which he resigned on having forfeited the favor of that nobleman. An edition of his works was published under his own inspection, by Tonson 1723, and since his death they have been often printed in various forms. One of the best editions is that of Latour, with a commentary and life of the author (Paris 1869). His 'Œuvres Poétiques' appeared with a commentary (1824), and 'Contes inédits' ed. by Luzache (Paris 1881).

ROUSSEAU, Jean-Jacques, in point of influence the most striking figure in modern French philosophy and literature: b. Geneva, 28 June 1712; d. Ermenonville, 2 July 1778. His mother died at his birth, so that in his own characteristic phrase his birth was the first of his misfortunes. His father was of unstable disposition and in his attitude toward his son wavered between over-fondness and neglect. He taught the lad his letters out of Plutarch and the French 17th century romances in his shop, where the two remained reading at times all night until they saw the swallows flying low under the eaves. Such indulgence hardly contributed to stabilize a temperament essentially unbalanced and to the end Rousseau was to worship the heroic and the romantic. He received very little regular training and ideas of rigorous discipline remained foreign to his life and thought, and we need not expect to find them in his later treatise on education. His father came into conflict with the authorities, and later married a second time, and there followed a period when the lad seems to have been left to shift pretty much for himself. For a little while he, with a cousin, was sent to a school in the country, kept by a retired pastor, and later apprenticed to an engraver where he was left largely to his master and his fate and where he learned the petty tricks and villainies of maltreated apprentices generally. On this whole period of his early life it is unwise to accept the 'Confessions,' our largest single source of information. Most of the facts there recounted are substantially correct and it is dangerous to assume, as has been done by Faguet and others, that he frequently misrepresented. It must be remembered that this eloquent autobiography was written half a century later when the author's mind had been unsettled by real or imaginary persecutions and when he believed himself in disgrace with fortune and men's eyes. For this reason, though he recounts and excuses the sordid events of his early youth, he looked back upon his childhood as a refuge, the first asylum of his innocence, and idealized his relations to his city, his father and his relatives, and theirs to him. That his boyhood in Geneva was spent in relative isolation and unhappiness will be plain to the student who ponders the significance of that event which is usually emphasized as the turning point of his life.

When 16 years old, he hurried back one Sunday from his walk in the country to see the city gates closed in his face. Up to this point there had been nothing in his story to indicate the rover or vagabond, nor any desire to "see the world," nor any unusual chafing under the restraints of his apprenticeship. That, however, there could not have been any bonds of affection to hold him to anything or anyone

within the gates of his native city is plain from his course. An untrained apprentice, absolutely without means, and as yet with no ulterior purpose or desire, he decides forthwith that he will not enter the home of his youth again, and he wanders about aimlessly in the environs. The parting caused no serious heart burnings, either to himself or to his father and relatives, and for the next quarter century he merely "stopped off" at Geneva once or twice in a most casual way. The varied life of vagabonding, study, desultory occupations and adventures of the next 20 years it is impossible to describe in brief or general terms. His two most important relationships were those formed with Mme. de Warens and with Diderot, toward the beginning and the end respectively of this long period in the maturing of his genius. The former, an over-generous woman of purse and person, received him at her home where in the course of years he was in turn guest, protégé, lover and intendant. From her he received perhaps his first lessons in gentility and while at her house developed an interest in music of which he was to become one of the great 18th century masters. There, too, especially at her country home, Les Charmettes, near Chambéry in Savoy, he began his first serious reading and study. In the intervals between his sojourns with Mme. de Warens and after his departure from her home he made many long trips, usually afoot, tried many desultory means of support, had many adventures and naturally saw much of the under side of 18th century society, which seems never to have seriously attracted him and against which he later sincerely if ostentatiously revolted. In 1743 he accompanied the French Ambassador to Venice and first came into close contact with political life and institutions. After his return to Paris (1744), he became more intimate with Diderot, who probably quickened his interest in philosophical and social problems, though Rousseau at this time was still primarily a composer, poet and musician. He lived with a dull and unattractive servant, Thérèse Le Vasseur, by whom he had five children whom he consigned to a foundling's asylum. One day in 1749 on his way to visit Diderot, who was at the time confined at Vincennes because of his 'Letter on the Blind,' he had that strange experience which was to inaugurate his amazing career as man of letters and reformer and beget his first epoch-making work. This contains in germ the ideas which he later softened and amplified and provides the best starting point for the study of his philosophy.

Before considering it in detail certain general considerations must be borne in mind. The greatness of Rousseau is due to the fact that his work marks the end of one era and the beginning of another. We may admit, as recent studies have shown, that the isolated elements, the *disjecta membra* of his philosophy, are to be found in predecessors and contemporaries. It is none the less true that he marks the end of classicism in literature and of medieval theories of the rights of empire and church in politics and religion. He tended to break the hold of all external sanctions in state, church, literature and society. His attitude toward the past is in general that of the modern radical. He starts on the other hand that immense enthusiasm for individual lib-

erty and emotional participation in life which is to be the most characteristic feature of romanticism. He will exalt freedom as against any externally constituted authority; natural impulse as against discipline, and the individual's feeling (which he was often to identify with conscience) as against any convention of society. Phases of this spirit were to exert extraordinary influence in Germany on Herder, Schiller and Kant, and in England on men like Godwin and Wordsworth, while in France its first powerful expression is to be found in the destructive enthusiasm of the Revolution. Such an attitude was essentially dynamic in an age that clamored for new principles, though it was weak on the constructive side, for it lacked elements of cohesion, and it was fraught with danger wherever, as only too often, it made the individual and not mankind the point of reference in all human relationships and actions. For all its dangers, however, it is hardly too much to say that this attitude was the most powerful regenerative force of the late 18th and 19th centuries. It is as contributory to this general body of doctrine that each of Rousseau's works should be judged if we are properly to gauge its historical importance. We have seen that by temperament and experience he was already peculiarly fitted to become its champion. He was essentially the *novus homo*, the man without attachments, who was as strange to the highly socialized life of 18th century Paris as a man from Mars. By temperament he was averse to discipline and control. The circumstances of his life had not as yet, indeed were never, to force either upon him. He had from a boy been at home in nature and was ever to feel awkward and constrained in society. His posture was, therefore, one of attack and he had been endowed with an extraordinary and as yet untried gift of eloquence.

Upon his way to Vincennes his eye fell upon an announcement that the Academy of Dijon was offering a prize for the best discourse on the subject whether the arts and sciences have contributed to improve morals. Putting the question thus sharply before him seems to have released all of his pent-up social antagonisms and as he tells the story he fell in a trance and began to write feverishly at his first famous essay. Naturally he answered the question with a ringing negative. The development of the arts and sciences, he said, not only did not improve man in habits and morals, but he implied that with their progress man deteriorated. Society corrupted man's native goodness. The discourse is naturally full of inconsistencies and it is less well written than its successors. Its importance, however, lies in its purport. It is this that makes it the harbinger of a new dispensation, for it presents society and existing institutions as the perverters of mankind. In other words it throws them upon the defensive and inaugurates the age of experiment and reform. His next discourse on 'The Origin of Inequality' (1753) is a much better if less striking performance and in it he distinguishes between natural and unnatural or social inequality. Its upshot very briefly is that the former,—inequalities of talent, natural endowment, etc.—are good and should be fostered, while the latter,—inequalities of social position, rank, inherited wealth, etc.—are evil,

JEAN JACQUES ROUSSEAU

go back to the institution of private property and should be abolished. For some time before 1750 Rousseau had been living in a position of relative comfort and had been received in the houses of the great. Possibly as the result of illness and from a desire for notoriety as well as from a constitutional inability to accept restraint, he decided to "reform" and live the simple life. He made no attempt to recover his wardrobe, which had been stolen, gave away his watch and sword and dressed in simple garb. In 1756 he retired to a cottage near the forest of Montmorency. Here he broke with most of his old friends, including Diderot and his patroness, Mme. d'Epinay. In this quiet neighborhood he pondered and wrote during the next six years his three great masterpieces, 'The New Heloise,' 'Emile' and 'The Social Contract,' which were published in 1761 and 1762. His misfortunes now increased with his fame and the remainder of his life is a tragedy clouded certainly by fixed delusions, possibly by periods of insanity. The 'Emile' was condemned in Paris and a decree pronounced against Rousseau which forced him to leave France for Switzerland. Geneva was no more tolerant and he suffered from real or imaginary persecutions or both, and moves from place to place in a mood that approaches distraction. He is consumed by the desire to justify himself and confute his enemies and his later works, 'The Letters to M. de Malesherbes,' 'The Confessions,' 'Rousseau Judge of Jean-Jacques' and the 'Reveries' are devoted to this end. David Hume, who respected his genius, invited him to England, but here his delusions followed him and he accused his benefactor of conspiring with his enemies. He returned to France, where he lived for a time in disguise, and finally with Thérèse, whom he had now married, he comes back to live in Paris (1770) until his death at Ermenonville (1778).

We have spoken in passing of the general spirit of his work and of its importance. Its general principles may roughly be stated as follows: God is good, nature is good, man is good. The great governing forces of the world make for righteousness and virtue. Evil, therefore, is not natural or fundamental, it is the result of perversion. Rousseau found its sources in the human institutions which have produced society and have begotten ambition. His problem was, therefore, not so much to master or counter its possible effects as it was to eliminate evil altogether and prevent its irruption into a world of whose complex it is not an essential element. It is here that he links up with the Utopians of whatever age or clime. This being the case, Rousseau's insistence is not upon discipline and control. On every side, individual, social, educational, political, he believes in expression rather than repression. His ideal government is that which least checks the impulse and desire of the individual and gives him the maximum of direct control in all State affairs. His ideal system of education is that one which least hampers the development of the pupil's native bent. His ideal social life is that which ignores convention and allows all characters, even of contradictory interests, to live in one hive of harmonious virtues. For this reason his novel, 'The New Heloise,' instead of being the tragic

story of two men who love the same woman, is a wonderful but impossible idyll. Unrestrained self-revelation is exemplified in the 'Confessions,' one of the most wonderful autobiographies in literature, and all told, probably his most valuable permanent contributions to pure literature. It remains not only a masterpiece of proud apologetics for a sorry and unhappy life, but the one indispensable document for him who would understand this strange sick genius who held so firmly and preached so eloquently his belief in the goodness of God, of nature and himself. It was this subjectivity of his, this individualism, this willingness to indulge in lyric expressions of his own griefs and joys that furnished a glowing precedent for that "pageantry of the bleeding heart" which was one of his greatest legacies to the later romantics. His title as father of romanticism is further justified by his magnificent descriptions and glorifications of nature. Indeed in this respect the famous lines of Wordsworth,

"One impulse from a vernal wood
May teach you more of man
Of moral evil and of good;
Than all the sages can."

are merely a later poetic restatement of the doctrine of this Genevan philosopher and man of letters. See CONFESSIONS, LES; EMILE; LA NOUVELLE HELOISE; SOCIAL CONTRACT.

The best complete edition of Rousseau's works in French is still that of Musset-Pathay (1823-26). John Morley's 'Rousseau' remains in spite of its inadequacy, especially on the biographical side, the most important study of the man in English. Frederika McDonald's 'J. J. Rousseau' (2 vols.) is a well-intentioned but occasionally uncritical attempt to justify Rousseau against his enemies and gives irrefutable evidence of the plot of misrepresentation. The important results of the recent attacks on Rousseau have been incorporated in Irving Babbitt's 'Rousseau and Romanticism' (1919), an able indictment rather than an open-minded criticism. Many of the important recent studies themselves and the results of all appear in the volumes annually published by the Rousseau Society of Geneva, 'Annales J. J. Rousseau,' which contains complete bibliographies. Of the longer recent works consult Ducros, 'J. J. Rousseau, de Genève à l'Hermitage' (1908); Vallette, 'J. J. Rousseau, Genévois' (1911); Faguet, 'Vie de Rousseau' (1911); Lemaitre, 'J. J. Rousseau' (1907); Mornet, 'Le sentiment de la Nature en France de J. J. Rousseau à Bernardin de St. Pierre' (1907). On Rousseau's philosophy consult *Revue de Métaphysique et de Morale* (Vol. XX).

CHRISTIAN GAUSS,

Professor of Modern Languages, Princeton University.

ROUSSEAU, Lovell Harrison, American soldier and legislator: b. Stanford, Ky., 4 Aug. 1818; d. New Orleans, 7 Jan. 1869. He was admitted to the bar in 1841, engaged in practice at Bloomfield, Ind., and was a member of the Indiana legislature 1844-45. He served in the Mexican War and in 1849 opened a law office in Kentucky, and became famous as a criminal lawyer. In 1860 he entered the Kentucky senate, but resigned to join the Union army. He was commissioned brigadier-general of volunteers in 1861, promoted major-general in 1862,

and fought at Stone River, Chickamauga and Chattanooga. From 1863-65 he was as in command of the district of Tennessee and successfully defended Fort Rosecrans during the siege of Nashville. He took his seat in Congress in 1865, but in the following year resigned it in consequence of being reprimanded by that body for a public assault upon Representative Grinnell of Iowa. He was, however, soon re-elected and served another year. In 1867 he was appointed brigadier-general in the regular army and assigned officially to receive Alaska from Russia and assume control of the territory. He was summoned from this post to testify in the trial for impeachment of President Johnson and was afterward until his death in command of the Department of the Gulf with headquarters at New Orleans.

ROUSSEAU, Philippe, French artist: b. Paris, 1816; d. Acquigny, 4 Dec. 1887. He studied under Gros, Bertin and Hippolyte Garneray, and first exhibited at the Salon in 1831. His early work was confined principally to landscapes; but he later painted animals, excelling in his pictures of monkeys, and also painted interiors, fruits and flowers with excellent color and light effects and rare taste for beauty. Among his works are 'The City Rat and the Field Rat' (Medal, Salon, 1845); 'Interior of a Farmhouse' (1850); 'Storks Taking a Siesta' (Luxembourg Museum); 'Breakfast' (Valenciennes Museum); 'Spring' (1869); 'The Wolf and the Lamb' (1875), etc.

ROUSSEAU, Pierre Etienne Théodore, French painter: b. Paris, 15 April 1812; d. Barbizon, near Fontainebleau, 22 Dec. 1867. He was a pupil of Rémond (1826) and of Lethière, but quickly parted company with all current theories of art, and showed himself an original interpreter of nature, while he fought the battle of the new landscape—"paysage intime"—through the 13 years during which his pictures were excluded from the Salon by the Academical Jury, which happily has since then been abolished. He traveled through the Auvergne and Normandy and painted the scenery with the main object of breathing human feeling into the colors and forms of external nature. He is the central figure of the Barbizon school and must be looked upon as the founder of the modern school of French landscape painting, as opposed to the Romanticism of Claude Lorraine, Poussin and their followers. It has been well said of him: "He occupied the highest place because he was the most perfect master. The grand aspect of landscape and its tenderness are equally familiar to him. He renders with the same mastery the smile of creation and its terrors; the broad open plain and the mysterious forest; the limpid, sun-bright sky or the heaping of the clouds put to flight by storms; the terrible aspects of landscapes or those replete with grace. He has understood all, rendered all, with equal genius. The greatest contemporary painters have each a particular stamp, Corot painting the grace; Millet, the hidden voice; Jules Dupré, the majestic strength. Théodore Rousseau has been by turns as much a poet as Corot, as melancholy as Millet, as awful as Dupré; he is the most complete, for he embraces landscape art absolutely."

In 1848 he took up his residence on the

edge of the forest of Fontainebleau and derived most of his inspiration from the surrounding scenery. How he drew the motif of his work from this environment is seen in the fine picture in the Metropolitan Museum, New York, 'Edge of the Woods.' Among other characteristic works may be mentioned 'View of the Valley of Paris and the Banks of the Seine'; 'The Forest Height of Compiègne' (1833); 'Avenue of Isle-Adam'; 'Entrance to the Forest of Fontainebleau' (1862); and 'Marsh in the Landes' (1854); the last two being in the Louvre. His early style was sketchy with some carelessness of touch, although absolutely sincere and impressionistic. Later he indulged in excessive detail, and never seemed to know when his pictures were finished, yet all his landscapes were tinged with the deepest poetic spirit. He never really won recognition during his lifetime, however, and after an unsuccessful auction-sale of his works in 1861 thought seriously of seeking a home in some foreign capital. It is said that a sense of this depreciation wore away his health. Yet in the last year of his life he took the medal of honor and since his death the genuine merit of his pictures has been acknowledged and as early as 1873 his 'Scene near Fontainebleau' was sold for \$2,360. Consult Sensier, 'Souvenir I has "sur" Théodore Rousseau' (Paris 1872).

ROUSSEAU'S CONFESSIONS. Jean-Jacques Rousseau. For us, who lived among scientific ideas familiarly applied, the name of Rousseau has lost its power to shock. Most of us have forgotten that to the eyes of the 18th century mankind appeared in the image of his maker, without body, parts or passions, and that to Rousseau belonged the discovery of man as he really is, with his structure as an animal, with his power as an idealist, with his limitations as a machine. The 'Confessions' must, therefore, be read, first of all in order that we may appreciate the effect of this discovery upon a society whose view of its own members had tended, until Rousseau appeared, to be distorted and sentimental. Secondly, it should be read because this presentation of a human being who felt himself to be different from other men became the starting-point for our own understanding of such human beings, and our belief in educating each according to his individual need. Lastly, it must be read because every school child in America owes much of the intelligent care of his training to the works of that unhappy, morbidly hypersensitive, little thief and coward of a Jean-Jacques. The service of truth is the service of God, and thus the impression which these often ugly 'Confessions' made on thoughtful people was almost a religious impression. George Eliot, for example, speaks of their effect on herself as crucial. Anyone who looks into the depths of his own nature, as Rousseau did, may see the same scurry of ill-formed wishes seeking cover in darkness, and tremble to think how close he is to the brute. But this book is not only a record of morbid feelings: it is also an account of a man's struggle with social injustice, told with emotional power, with a feeling for beauty and for nature, which heightened his style above the great accents of his time. This struggle continues; it has changed and is yet

changing the face of the world. Rousseau has taught us all to feel sympathy for the individual who needs special training. The facts he gave about himself have become the classic material of modern educators. He describes an early life spent in miserable servitude to unworthy masters, lacking in health, self-confidence, equal friendships or steadfast purpose. The son of a Swiss watch-maker, he drifted about from situation to situation, never secure in his patron's favor, and sick with rage at owing each advance in life to some base caprice or to his own servile weakness. His intense egotism became his only refuge, while faith in his own powers ultimately raised him above his vices. None of his critics has been more severe than he; and he knew that there was nothing in his circumstances to help him overcome his nervous tension, his irritable sensitiveness. All these things he set down with close detail and unexampled beauty of language, describing the play of life upon his nerves and imagination, his conflicts, his errors, his rise to literary power. Although no translation of the 'Confessions' exists which does it full justice, yet no book has had more influence on English literature, and its value deepens with the advance of psychology. Surely, it was his own individual struggle which lent such poignant emotion to that famous sentence of the Social Contract—"Man is born free, yet everywhere he is in chains." It was his personal experience of that civilization which he felt was wrongly leading men away from nature, which caused his books to become the inspiration and his voice the trumpet call of modern democracy. We of to-day must, therefore, feel that Rousseau's delight in the beauty and dignity of Nature, his faith in the essential beauty and dignity of human life, draw him closer to us and serve to outweigh the dark and morbid moments of his narrative. Much of the smiling and liberal aspect which life to-day wears for any ambitious youth has been gained for him by the work of this unhappy man, who never relinquished or denied an ideal because he often fell so pitifully short of it. With a lacquey's vices and from a lacquey's condition, he yet managed to raise himself to a throne in the kingdom of ideas. Because he lived, the life of the young is happier than it was, and this fact should give pause to those who are shocked by his candor. Lord Morley is one of these, and Mr. Birrell thinks the 'Confessions' ought never to have been written, "but written they were," he adds, "and read they always will be." To say that a book will always be read seems to us a high form of praise; but surely the 'Confessions' need no justification. When we turn to the history of our own country, we hear the voice of Rousseau urging on the founders of the Republic: and it has even been said that Rousseau, by inspiring Jefferson, is the real author of the Declaration of Independence. The life, by himself, of one whose ideas yet live in that Declaration and in the schools of the world, is full of interest, an interest heightened because we now believe, with Jean-Jacques, that each of us is "different," and that those of us who are healthy, vigorous, living in the light, may be benefited by knowledge of the others, who—generally through no fault of

their own—are frail, abnormal, living under the shadow of mental or moral infirmity.

ANNA ROBESON BURR.

ROUSSEL, roo'sêl, Gérard, French bishop and reformer: b. Vauger, near Amiens, about 1480; d. Mauléon, 1550. He studied at Paris, became a friend of Lefèvre d'Étaples, and shared his exile when his theories of Reformation were the cause of his being driven to seek safety at Meaux in 1521. Later Roussel was himself compelled to flee to Strassburg to avoid imprisonment on a charge of heresy; but in 1526 he was recalled by Francis I and became court preacher to Margaret of Orleans. After her marriage to the king of Navarre in 1527 he became her confessor, and in 1536 he was appointed bishop of Oléron. While a believer in reformation he held it not incompatible with continued connection with the Roman Church and under the protection of his patroness he occupied a sort of intermediary position between the Reformation and Rome, although his writings and preaching were twice condemned by the Sorbonne. While preaching a sermon advocating a reduction in the number of church festivals he was attacked by fanatics and received injuries from which he died. Author of 'Expositions'; and a number of tracts and translations. Consult Schmidt, C., 'Gérard Roussel' (1845).

ROUSSELOT, roo-sê-lô, **Abbé Jean Pierre**, French phonetician: b. Saint-Cloud, Charente, 1846. He was early engaged in teaching and as a curate and vicar, but studied at the University of Paris and took his degree in letters in 1892. He was appointed assistant professor of French philology at the Catholic Institute, Paris, in 1887; and established there the first course in experimental phonetics. He planned the laboratory of experimental phonetics at the Collège de France and became its director in 1897. He invented a number of valuable phonetic instruments and methods to aid the deaf and to correct impediments in speech. He edited *Revue des patois Gallo-Romans* in 1887-93. Author of 'Principles de phonétique expérimentale' (1897); 'Précis de prononciation française' (1902), etc.

ROUTH, Edward John, British mathematician: b. Quebec, Canada, 28 Jan. 1831; d. Cambridge, England, 7 June 1907. He went to England at the age of 11, was educated at University College, London, and at Cambridge, and was elected a Fellow at Peterhouse, Cambridge, in 1857. He was a famous mathematical tutor, 500 out of his 700 pupils becoming wranglers; while, for 22 consecutive years, 1861-82, the senior wrangler was trained by him. He was an examiner at both University College, London, and at Cambridge. With Lord Broughton he wrote 'An Analytical View of Newton's Principia' (1855). He was also author of 'Essay on the Stability of a Given State of Motion' (Adam's Prize, 1877); 'Treatise on Rigid Dynamics' (2 vols., 1860; 7th ed., 1905); 'Treatise on Analytical Statics' (2 vols., 1891; 2d ed., 1896-1902); 'Dynamics of a Particle' (1898), etc.

ROUTHIER, roo'tyâ, **Sir Adolphe Basile**, Canadian jurist and author: b. Saint Placide, Quebec, 8 May 1839. He was educated at Laval University and was called to the bar in 1861.

He became queen's counsel in 1872; was appointed judge of the Superior Court for Quebec in 1873 and was named chief justice in 1904. He was also judge of the Vice-Admiralty Court of Quebec from 1897 until his retirement from the bench in 1906. He was knighted in 1911. He was known as a writer of essays, verse and travels. Author of the Canadian national song 'O Canada'; 'A Travers l'Europe'; 'A Travers l'Espagne'; 'Les Echos' verse; 'Le Centurion,' novel; 'De l'Homme Dieu,' apology for Christianity, etc.

ROUTLEDGE, rout'lēj, George, English publisher: b. Brampton, Cumberland, 23 Sept. 1812; d. London, 13 Dec. 1888. He established himself as a bookseller in London in 1836 and as a publisher in 1843. His house became famous for its pioneer work in the publication of good books in cheap editions; his "Railway Library" selling at a shilling and presenting the works of Washington Irving, Fenimore Cooper, Bulwer Lytton and Benjamin Disraeli. Harriet Beecher Stowe's 'Uncle Tom's Cabin' was included in this series and sold more than 500,000 copies. Routledge's 'Universal Library,' edited by Henry Morley, also sold at a shilling a volume. The firm name, originally Routledge, Warne and Routledge, later became George Routledge and Sons. Its New York branch was established in 1854.

ROUVIER, roo'vyā, Maurice, French statesman: b. Aix, 17 April 1842; d. 7 June 1911. He was educated for the law but engaged in business at Marseilles and in 1870 founded the anti-imperialist paper *L'Égalité*. He was elected to the Chamber of Deputies in 1871 and became a recognized authority on finance. He was Minister of Commerce and the Colonies in the Gambetta Cabinet in 1881-82, and filled that post in the Ferry Cabinet in 1883-85. He was Premier and Minister of Finance in 1887, but his Cabinet fell through its attempt to shield President Grévy in the scandal connected with the barter in the decorations of the Legion of Honor. He was Minister of Finance in the Tirard, Freycinet, Loubet and Ribot cabinets. The Panama scandals in 1892 involved his office and he was compelled to retire, but he was reinstated in the Combes Cabinet in 1902. In 1905 he became Premier for the second time, and during the Moroccan crisis with Germany he took over the portfolio of Foreign Affairs. The Separation Law was enacted in his administration, putting into effect Rouvier's long fought-for separation of church and state, but his ministry did not long survive it, and in 1906 he was succeeded by the Sarrien Cabinet.

ROUX, roo, Pierre Paul Emil, French physician and bacteriologist: b. Confolens, Charente, 17 Dec. 1853. He was educated at the School of Medicine at Clermont-Ferrand and at the University of Paris. Since 1878 he has been connected with the Pasteur Institute, and has been director there since 1904. He assisted Pasteur in researches connected with the ætiology of carbon and the treatment of hydrophobia; is widely known for his work with diphtheria and the anti-diphtheria serum; was engaged with Nocard in researches resulting in the discovery of the pneumonia microbe; and likewise made researches into the nature and possibility of prevention and cure of tetanus,

syphilis and other infectious diseases. He was elected to the Academy of Medicine in 1895, the Academy of Science in 1899 and in 1903 received the Osiris Prize of \$20,000 from the Institute.

ROVE-BEETLES, or **COCKTAILS**, names applied to a tribe of beetles, the *Staphylinidae*, characterized by elytra only about one-fourth of the length of the abdomen. A common species is the 'Devil's Coach-horse' (*Georus olens*), a fanciful name given to it from its diabolical aspect when it curls up the abdomen and opens its jaws. These beetles are carnivorous in habits, and are apt to bite if incautiously handled. The habit of cocking the tail has been alleged to have for its object the function of pushing the hinder wings under the short elytra, which are formed by the front wings and which protect the hinder or functional wings. These beetles fly about chiefly in the dusk and at night. The tarsi generally possess five joints.

ROVUMA, rō-voo'mā, a river of Africa, which rises east of and near Lake Nyassa, and flows east into the Indian Ocean. It forms the boundary between German East Africa and Portuguese East Africa. It is about 500 miles long. For about 80 miles from the mouth there are high lands along the banks and about 160 miles from the ocean are a number of beautiful cascades and waterfalls. The river is navigable for some distance. It was first explored by Livingstone in 1861.

ROWAN, row'an, Andrew Summers, American army officer: b. Gap Mills, Va., 23 April 1857. He was graduated from West Point in 1881, served on the frontier till 1890, when he was detailed on surveying duty in Central America as a member of Party No. 1 (Macomb's), and after the opening of the Spanish-American War in 1898 was sent to communicate with General Garcia. He made a landing from an open boat near Turquino Peak, Cuba, on 24 April 1898, and with much difficulty succeeded in reaching Garcia, obtained full information of the insurgent army, and made the return trip successfully, was the first American army officer to enter Cuba after the declaration of war. He was promoted lieutenant-colonel, United States army, for this service, and in 1899-1902 was on duty in the Viscayas Group, Philippine Islands. He was professor of military science and tactics at the Kansas State Agricultural College, 1902-03. He retired in 1909. He has written 'The Island of Cuba' (1898). Was the subject of Elbert Hubbard's 'A Message to Garcia' He has been engaged in literary work since quitting the active list, and is now at work on a history of Mexico.

ROWAN, Stephen Clegg, American naval officer: b. near Dublin, Ireland, 25 Dec. 1808; d. Washington, D. C., 31 March 1890. He came to the United States when very young and in 1826 was appointed a midshipman in the navy, receiving promotion to lieutenant in 1837. He saw active service in the Mexican War and in 1855 he was appointed commander. At the outbreak of the Civil War he was in charge of the *Paumee*, and on 25 May he engaged in the attack on the Confederate batteries at Acquia Creek, the first naval engagement of the war. He assisted in the capture of Fort Hatteras,

and was promoted captain and commodore for his services. He was engaged at Roanoke Island and Albemarle Sound, and later captured Fort Mason, thereby restoring National authority in North Carolina. He was in command of the *New Ironsides* at forts Wagner, Gregg and Moultrie, received the thanks of Congress, and in 1866 was promoted rear-admiral. He became vice-admiral in 1870, and from 1883 until his retirement in 1889 was chairman of the light-house board.

ROWBOTHAM, rō'bōt-əm, John Frederick, English Anglican clergyman, poet and historian: b. Bradford, Yorkshire, 18 April 1859. He was educated at Oxford, traveled extensively on the Continent, and took orders in the Church of England in 1891. He was vicar of Ratley in 1892, rector of Huntley in 1895, British chaplain of Budapest and Hungary in 1896, and vicar of Abbotsley 1897-1900. He has published 'The History of Music' (3 vols., 1887); 'Poetical Works' (1889-90); 'The History of the Troubadours and the Courts of Love' (1895); 'The God Horus, a Novel of Ancient Egypt' (1898); 'The Human Epic' (1902), etc.

ROWE, rō, George Fawcett, English-American actor: b. Exeter, about 1829; d. New York, 29 Aug. 1889. He made his first appearance on the stage in Australia in 1854; toured through India, China and Peru, and appeared in New York in 1866 under Mrs. John Wood's management at the Olympic. His most famous part was Wilkins Micawber in Halliday's dramatization of 'David Copperfield.' He also played Silas Wegg in 'Our Mutual Friend,' and many other comic and farcical parts, some in pieces of his own composition, such as 'Brass'; 'The Geneva Cross'; 'Found Drowned'; and 'The Sleigh Bells.' His last appearance was at the Colosseum Theatre, London, as Rufus Potts in 'Forward to the Front,' 27 April 1889.

ROWE, Leo Stanton, American economist: b. McGregor, Iowa, 17 Sept. 1871. He was graduated at the University of Pennsylvania in 1890, and took his Ph.D. at Halle in 1892. He was admitted to the bar, and in 1895 became a member of the faculty at the University of Pennsylvania, where since 1904 he has been head professor of political science. He was in 1900-01 a member of the Commission to Revise and Compile the Laws of Porto Rico; and in 1901-02 was chairman of the Insular Code Commission. He was secretary-general of the Panama-American Financial Conference and of the International High Commission at Washington, D. C., in 1915; and in 1917 was appointed Assistant Secretary of the Treasury. He was joint author of 'Report of the United States Commission to Revise the Laws of Porto Rico' (2 vols., 1901); 'Report of the Insular Code Commission' (8 vols., 1902); and author of 'The United States and Porto Rico' (1904); 'Problems of City Government' (1908), etc.

ROWE, Nicholas, English dramatic poet: b. Little Barford, Bedfordshire, 1674; d. 6 Dec. 1718. He studied at Westminster, entered as a student at the Middle Temple, but turned his chief attention to literature. At 24 he produced his tragedy of the 'Ambitious Step-mother'; 'Tamerlane' followed in 1702. His next dramatic performance was the 'Fair Peni-

tent,' remodeled from the 'Fatal Dowry' of Massinger. In 1704 he wrote 'The Biter,' a comedy, which being a failure, he thereafter kept to his own line, and from that time to 1715 produced his 'Ulysses,' 'Royal Convert,' 'Jane Shore' and 'Lady Jane Grey.' On the accession of George I in 1715 he was made poet-laureate. He wrote a few tender and pathetic ballads, translated Lucan's 'Pharsalia,' and edited the plays of Shakespeare (1709). The memoir prefixed to the plays contains much traditional matter judiciously presented.

ROWELL, rōw'el, Newton Wesley, Canadian lawyer and statesman: b. Middlesex County, Ontario, 1 Nov. 1867. He was educated in the public schools and at the Ontario Law Society; was called to the bar in 1891, and in 1902 became king's counsel. He attained a reputation as a leader of the Ontario bar; and in 1911 was elected to the Ontario legislature, where he became the leader of the Liberal Opposition. He is an earnest worker for legislation to improve social conditions, particularly factory laws, workmen's compensation, shorter hours of work for women and children, and to problems of housing, taxation and temperance reform. He was president of the Privy Council of Canada in 1917; and a member of the Imperial War Council in 1918.

ROWING, the propelling of floating rafts, boats or barges by means of oars, is the most ancient of all methods of traveling by water. As evidenced by some of the oldest Egyptian carvings rowing was a well-established practice before history began to be written and remained the chief mode of propelling even of war craft of considerable size long after the art of sailing was invented. Three hundred years before Columbus discovered America the watermen of the Thames were linking the art of rowing inseparably with the sterner history of England in transporting the barons to Runnymede in 1215 to witness the signing of Magna Charta in boats and barges propelled by oars.

Just when rowing began to commend itself to the attention of gentlemen of leisure as a new outdoor sport is not a matter of record. However, it appears that in 1715 an English actor, Thomas Doggett by name, instituted a boat race among the watermen of the Thames, offering as a prize a waterman's coat with a conspicuous silver badge upon the arm. The occasion was so great a success that he established a fund to provide in perpetuity the prize for the annual celebration of such a contest, which is known to this day as the 'Doggett's Coat and Badge Race,' from the reward of the successful boatman. Following the initiative of Doggett the practice became general of organizing boat races between the Thames watermen, and there was no lack of sportsmen to contribute prizes as incentives to vigorous contests.

The introduction of the Venetian Regatta, first conducted on the Thames in 1775, added enormously to the popular interest in water sports, and by the opening years of the 19th century rowing had become one of the standard athletic diversions of the people. Several boat clubs were in existence, and special racing boats for six-oared and eight-oared crews had been built. The names of the first four clubs, 'Star,'

"Arrow," "Shark" and "Siren," have been preserved in the annals of the time. The records show that in 1811 Eton had three 8-oared boats and one 10-oared boat; and that in 1813 Westminster School had a six-oared boat. In 1818 a challenge to race was sent by the Eton crew to the Westminster crew, but the authorities prevented the race. In 1829, however, the crews of these two schools rowed the first of a series of matches which spread irregularly over the period up to 1847. For 15 years these contests were abandoned, to be renewed for a brief period in 1862, the Westminster school then giving up their boating.

The first amateur races were between two rival picnic boats on the Thames in 1826. This became a favorite sport, and it became a common practice to enliven picnic parties on the river by improvising such boat races.

The first intercollegiate race was rowed at Henley in 1829, the Oxford crew winning from Cambridge. Oxford had begun rowing races among its own classes in 1815, and Cambridge took up the sport a year or two later. The second meet of these two colleges was not until seven years afterward, and from that time forward these races were held at irregular intervals until 1856, since which year the Oxford-Cambridge race has been an annual occasion, up to the outbreak of the War of 1914.

The Henley Royal Regatta was established by the town of Henley in 1839. The series of contests was open to all amateur crews in eight-oared boats and to any four-oared crews of the town. The first regatta comprised five races. This regatta is now held annually and is the greatest rowing event of the world. The course is one mile—550 yards. The races are rowed against the stream, and the time is close to seven minutes.

In America.—The first college races in the United States were between boats owned by Yale students, in Boston Harbor in 1844, the contestants being an eight-oared gig and a dug-out canoe. The first intercollegiate race was rowed in eight-oared barges by Yale and Harvard crews in 1852, over a two-mile course on Lake Winnepesaukee. In 1855 the two colleges raced again over a three-mile course at Springfield, Mass. For nine years thereafter they rowed at Lake Quinsigamond and in 1869 at Lake Saltonstall. For the seven years following no Yale-Harvard races were contested, but in 1876 they were resumed on a four-mile course at Springfield. In 1877 they rowed again on this course, and since then the races have been rowed on the Thames River at New London, Conn., annually up to 1916. No races were made during 1917 and 1918 on account of the war. The fastest time ever made on this course was 20.02 minutes by Harvard, on 23 June 1916. In this race Yale's time was 20.17 minutes—beating the previous record of 20.20, made by the Yale crew 26 June 1902.

In 1859 the first intercollegiate regatta was held at Springfield, Mass., and from that time onward this meet was an annual event until 1875, when 13 colleges were represented. The racing boats of that period were six-oared shells. The adoption of the eight-oared boat and the four-mile course by Yale and Harvard, and their consequent withdrawal from the intercollegiate races put an end

for the time being to these contests. They were revived, however, in 1900, when the new Intercollegiate Association formed in 1895 by Columbia, Cornell and Pennsylvania, selected the four-mile course at Poughkeepsie, N. Y. In this first of the new series of regattas crews of Pennsylvania, Wisconsin, Cornell, Columbia and Georgetown contested. Pennsylvania won in 19 minutes 44 $\frac{3}{5}$ seconds, the others finishing in the order named. In 1901 a crew from Syracuse University joined the other five, and Cornell won the race in 18 minutes 53 $\frac{1}{5}$ seconds, the fastest time ever made over this course. In 1907 Annapolis participated, and in 1912 Leland Stanford, Jr., University sent a crew.

The best time for four-oared crews made over two miles of the Poughkeepsie course was recorded for a Cornell crew in 1915—10 minutes 0 $\frac{1}{5}$ second.

No races were held by this association in 1917 and 1918 on account of the war. Yale and Pennsylvania raced with two crews each at Philadelphia and the regular regatta of the New England Amateur Rowing Association was held on the Charles River on the Fourth of July of that year, but a general suspension of the sport on account of the war marked the season of 1918. See SPORTS.

ROWING, Technics of. Rowing is the method of propelling a boat by the use of oars. It consists of two parts—the stroke and the recovery, which are executed by a series of complex motions designed to apply a maximum of available motive energy in urging the boat through the water, and at the same time ensure the least amount of deviation from a straight course.

In preparing to row the oarsman sits on the thwart, facing the stern and exactly opposite the handle of his oar, the shaft of which rests in the rowlock with the button on the inner side. To obtain the maximum effect from the power exerted he should sit about two inches from the after edge of the thwart, the body being held square and upright, the back straight and rigid, the feet pressed firmly against the opposite stretcher or foot board with the heels

FIG. 1.—Position beginning of stroke.

close together and the toes apart, so as to keep the knees separate. The handle of the oar should be held firmly by both hands which should be about three inches apart with the outside one close to the end of the handle, the

fingers being above and the thumb underneath. The grasp should be a flexible hold with the fingers and not a clutch with the whole hand. The forearms should be kept below the level of the handle, with the elbows down, close to the sides of the body. The wrists should be relaxed and dropped, so that the blades of the oars will lie flat upon the surface of the water.

FIG. 2.—Position halfway through stroke.

The stroke is characterized by four distinct phases—the catch, the drive, the pulling through and the finish. The recovery which includes the shoot, the feather and the full reach. In taking the stroke, the body is inclined forward, the backbone being kept straight and rigid, the shoulders thrown forward and held up as high as possible, while the abdomen is kept well out and down between the legs. The arms should reach out perfectly straight from the shoulders to the wrists and the action of the shoulder joints and the hips should be perfectly free and easy. In reaching forward the oar handle is grasped firmly by the fingers, and the hands are shot out quickly straight from the body, and as soon as the oar

FIG. 3.—Position finishing of stroke.

has been passed over the knees, the wrists are raised so as to bring the blade at right angles to the surface of the water and preparatory to dipping it, at the beginning of the stroke when the arms reach the extreme limit of their forward movement directly over the stretcher. At this instant, the hands are raised and the blade is dropped firmly into the water and buried un-

til it is covered up to the shoulder. The pull begins with the drive of the legs, a steady thrust of the feet strongly against the stretcher, the power being transmitted to the oars through the arms by the tense muscles of the rigid back. This leg action is the greatest power utilized in rowing, and the most should be made of it. The pull with the arms supplements the leg drive as the body sways backward. The finish of the stroke is achieved by the arms alone, and as the boat is at the moment at its greatest speed the movement is the quickest demanded in the stroke; the wrists are raised and the oar turned so that the blade slips instantly out of the water and into the position of feathering. During the entire stroke the arms should preserve, as nearly as may be, a right angle with the line of the oar, that position giving the largest leverage. The recovery begins immediately after the blade of the oar slips out of the water at the finish of the stroke. The object is to get the oar back into its first position in readiness for another catch. This position is termed the full reach. During the recovery several things have to be taken care of. For one thing the boat must be preserved upon an even keel; partly by the feathering of the oar along the surface of the water, but mainly and preferably by the grasp

FIG. 4.—The "Recovery." (Position of the hands and wrists in the act of feathering).

of the feet upon the toe-straps on the stretcher board. The movement is complicated in the case of the sliding seat. Assuming this to be in use, the leg-drive has thrust the seat back at the beginning of the stroke, before the arms begin to do their particular share. In the recovery the seat must be brought back to its first position. But, as the arms made the last movement in finishing the stroke, so in the recovery they make the first move in the shoot. This motion is very quick. The body necessarily moves much slower, and it must swing over from the bend backward to the bend forward. During this swing of the body the sliding seat must be returned to its first position. It is necessary that these two latter movements be made gently in order that the inertia of the moving boat be not checked by a jerking force in the contrary direction. By gently is not meant slowly: in fact the movements must be made as swiftly as possible. When skilfully done the sensation to the rower is that he has simply permitted the boat to glide forward under him. The very last part of the recovery is the full reach, accom-

plished by thrusting both shoulders forward like the wings of a hinge, with the rigid backbone as the centre. The instant the full reach is attained the oar should go into the water for the next catch. It is a serious fault to "hang" momentarily at the reach before taking the catch.

FIG. 5.—A common but very bad position. (Beginning of stroke).

The motion of the body should be as constant, smooth and steady as that of a pendulum, while the action of the hands and the wrists, producing the dipping and the feathering, should be entirely free from jerks. When the boat contains a number of oarsmen, each one keeps his eyes on the back of the oarsman in front of him, and times his swing from him; or in other words "keeps eyes in the boat."

A boat is "held" or has its headway stopped, by laying the blade flat and then sinking its forward edge slightly into the water. The blade is thus buried at an acute angle and checks the way of the boat gradually until it has been sufficiently reduced to allow of the blade being reversed square, to "back water." If the boat is under much headway, any attempt to back water before it has been held would be attended with disastrous results, as the resistance would prove greater than the strength of the oars and cause a fracture.

In sculling, a scull or oar is held in each hand, instead of one oar handle being held in both hands, as in rowing. The grip on the scull is governed by the rules applicable to the grip on the oar handle in rowing, but with the exception that the thumb should cap the butt of the scull handle with the top joint and not clasp around it. The action of the body, legs, arms, wrists and hands are also the same as in rowing, but in sculling some advantage may be gained by allowing the body to swing farther back at the finish of each stroke. Both hands should work together, and both blades should enter and leave the water at the same time. Up to 1856 racing boats were clinker-built; the smooth skin boat was then introduced, and in 1857 was generally adopted as somewhat faster. The sliding seat invented in America by Walter Brown, in 1869, was used by the Yale crew in its race with Harvard in 1870, and Yale won. It was used at Henley for the first in 1872, and in 1873 was instrumental in cutting the time on the $\frac{4}{4}$ mile course by half a minute. The changes since then have been few. It was at one time believed that shortening the boat would make it speedier, and the dimensions of the 8-oared boat were changed from 63 feet in length and 16 inches in width, to 58 feet in length and 20 inches in width. No appreciable gain was secured; although the

shorter boat was faster with some crews, the longer was faster with others. For the single sculler, however, the short boat proved unquestionably faster. As now in use the oars are 12 feet 1 inch to 12 feet 6 inches in length, and the blades vary from $5\frac{1}{2}$ to $7\frac{1}{2}$ inches in width; the short oars having the wider blades. In America, as a rule, the long oar with the narrower blade is preferred. The slide of the seat varies from 12 to 17 inches, although up to 20 inches is allowed, depending upon the individuality of the oarsman. It has been definitely proved that if the body bends too far backward it is impossible to recover quickly, and that the muscles of the back quickly show fatigue. With the longer slide the back need not incline so far. While formerly the swaying of the bodies of the men in the crew was carefully synchronized, it is now recognized that this is of little importance so long as the action of the oars in the water is symmetrical and exact; and far more freedom is permitted to the individual in body movement so long as his work at the blade of the oar is accurately timed. Consult Stevens, A. W., 'Practical Rowing' (Boston 1906); Warre, E., 'On the Grammar of Rowing' (Oxford 1909).

ROWLAND, rō'land, Henry Augustus, American scientist: b. Honesdale, Pa., 27 Nov. 1848; d. Baltimore, Md., 16 April 1901. He was graduated from the Rensselaer Polytechnic Institute in 1870, and taught for a year in Wooster College, Ohio, but in 1872 returned to the Institute, where he was instructor in physics, becoming assistant professor in 1874. He studied for a time in Germany, and in 1876 accepted the chair of physics at Johns Hopkins University, which he occupied until his death. He was a member of the Electrical Commission in Paris in 1881, and was elected to the National Academy of Science in that year. He was the inventor of a greatly improved process of ruling large diffraction gratings directly on concave mirrors, constituting what is known as the dividing engine (q.v.), with which he succeeded in making photographs far superior to any which had then been made. He made numerous valuable investigations and experiments, particularly in electricity, among them an extremely accurate determination of the ohm, a work which he afterward extended under the government. He was author of more than 100 scientific papers and monographs, among which are 'Magnetic Permeability' (1873); 'Magnetic Effect of Electric Connection' (1876); 'Research on the Absolute Unit of Electrical Resistance' (1878); 'On the Mechanical Equivalent of Heat' (1880); 'Photographs of the Normal Solar Spectrum' (seven plates, 1886), etc.

ROWLANDITE. A rare yttrium mineral $2Yt_2O_3 \cdot 3SiO_2$, occurring in small quantities at Baringer Hill, Llano County, Tex.

ROWLANDS, Samuel, English satirist and poet: b. about 1570; d. about 1630. He wrote numerous pamphlets in both prose and verse, many of them of a religious order and others keenly satirizing the social conditions of his day. His first pamphlet, 'The Betraying of Christ' (1598), was a religious poem and he wrote many others, but his work is remembered for his satires which are interesting to posterity chiefly through their historical importance as a source of information concerning

the social life of his time. His first satires, 'The Letting of the Humours Blood in the Head-Vaine' (1600) and 'A Mery Meetinge, or Tis Mery when Knaves Mete' (1600), were directed against several prominent persons whose names were thinly disguised in Latin. These were burned by the authorities, but were later republished under different titles. Afterward his satires chiefly concerned the middle and lower classes of society, some of them dealing with highwaymen of note and offering a highly interesting vocabulary of thieves' slang of the day. Several of his known works are lost. Besides works already mentioned he was author of the satires 'Tis Merrie When Gossips Mete' (1602); 'Humor's Looking-Glasse' (1608); 'Martin Mark-all, Beadle of Bridewell' (1610); 'Good Newes and Bad Newes' (1622), etc. His last work was a religious volume 'Heaven's Glory, Seeke it; Earth's Vanitie, Flye it; Hells Horror, Fere it' (1628).

ROWLANDSON, rō'land-sōn, Mary White, American captive among the Indians. She was carried away by the Indians after an attack on Lancaster, Mass., 10 Feb. 1675, during King Philip's War. For a time she was kept in an Indian village near the site of Petersham, Worcester County, and later was taken by her captors across the Connecticut, and after about three months was ransomed. Her 'True History' of her captivity and restoration was printed at Cambridge, Mass., and in London, in 1682. A fifth edition was prepared by Joseph Willard (1828), and is reproduced in 'Narratives of the Indian Wars' (New York 1913). The work, though not always clear as to detail, is interesting, and throws a graphic side-light on Indian existence with its cruelty and squalor.

ROWLANDSON, Thomas, English artist: b. London, July 1756; d. there, 22 April 1827. He was sent at 15 to Paris and there studied art and gained a taste for the pleasures of the town. The £7,000 left him by a French aunt he gambled away, yet he hated debt, and maintained his uprightness of character. He traveled over England and Wales, and enjoyed life to the full in his tavern and the company of friends like Morland, Gilray and Bonbury. Rowlandson possessed rare dexterity of touch and fertility of imagination; and, though not seldom vulgar, he was never feeble. He was a relentless hater of Napoleon, belittling his greatness by countless travesties. Some of his best-known works are his 'Imitations of Modern Drawings' (1784-88), and his illustrations for 'Syntax's Three Tours,' the 'Dance of Death,' 'Sterne's Sentimental Journey,' 'Peter Pindar,' the 'Bath Guide,' 'Munchausen,' etc.

ROWLEE, rou'lē, Willard Winfield, American botanist: b. Fulton, N. Y.; d. 15 Dec. 1861. He was graduated at Cornell University in 1888, became connected with the faculty there in that year and since 1905 has been professor of botany. He is a contributor to botanical journals and is author of 'Lieut. Herman Rowlee (1746-1818) and His Descendents' (1907).

ROWNTREE, roun'trē, B. Seebohm, English manufacturer and sociological worker, son of Joseph Rowntree (q.v.): b. York, 1871. He was educated at the Friend's School, York,

and at Owens College, and became a director in his father's business. He is active in social and political work. Author of 'Poverty, a Study of Town Life' (1910); 'Land and Labour' (1910); 'How the Labourer Lives' (1913); 'The Way to Industrial Peace' (1914); 'Human Needs of Labour' (1918), etc.

ROWNTREE, Joseph, English manufacturer and social worker: b. 1836. He came of a Quaker family, was educated at the Friends' School, York, and later engaged in business. He established the firm Rowntree and Company, cocoa manufacturers, of which he is chairman. He is active in work for social improvement. Joint author of 'The Temperance Problem and Social Reform' (7th ed., 1900); 'British Gothenburg Experiments'; 'Public Control of the Liquor Traffic' (1903); 'The Taxation of the Liquor Trade' (1909), etc.

ROWSON, rō'sōn, Susanna Haswell, American actress and author: b. Portsmouth, England, 1762; d. Boston, 2 March 1824. Her first work, the novel, 'Victoria,' appeared in England in 1786, and in 1792 she made her stage debut at Edinburgh. In 1793-96 she acted in the United States, closing at Boston with a comedy by herself, 'Americans in England.' From 1797 until her retirement in 1822 she conducted with much success a seminary for young ladies, first at Boston, and from 1800 at Medford. Her most popular work was 'Charlotte Temple, or a Tale of Truth' (1790), which had in its time wide sale, but is called by Wendell a "comically extravagant example" of a literary manner then much in favor. Further she wrote, among several volumes, 'The Inquisitor' (1788); 'The Volunteers' (1793); 'Miscellaneous Poems' (1804). There is a memoir by Nason (1870).

ROWTON, row'tōn, Montagu William Lowry-Corry, 1st Baron of, English lawyer and philanthropist: b. 8 Oct. 1838; d. London, 9 Nov. 1903. He was educated at Trinity College, Cambridge, became a barrister in 1863, and entered upon a successful career as a lawyer. He was secretary to the Earl of Beaconsfield in 1866-68 and in 1874-80, and was secretary of the special embassy sent to the Berlin Congress in 1878. He was created a baron in 1880. He established the Rowton lodging-houses in London some three years before the Mills Hotels were instituted in New York. They were built with the idea of furnishing decent and comfortable lodgings for workingmen and furnishing them also with well-cooked and substantial food at very moderate rates, yet at the same time with the intention of keeping the enterprise on a paying basis. He was chairman of the Rowton Houses and of the Guinness Trust until his death.

ROWTON HEATH, England, a place near Chester, which was the scene of a battle 24 Sept. 1645, in which the Parliamentary forces defeated the Royalists. After the crushing disaster of Naseby, King Charles I had fled to Wales, and then formed the desperate project of marching north to Montrose. Chester was then being besieged by Sir William Brereton, but the king at the head of 5,000 troops succeeded in finding an entrance, and entrusted Sir Marmaduke Langdale with raising the siege. The Parliamentarians had just been re-

inforced by Poyntz's Yorkshire horse when Sir Marmaduke attacked them. He was utterly defeated, with a loss of 300 killed and 1,000 prisoners, and the disaster, added to Philiphaugh, deprived the unhappy king of his last hope.

ROXBURGHE CLUB, an English book club founded in London in 1812, during the auction sale of the Duke of Roxburghe's famous library. The title of founder was claimed by Rev. Thomas Fognall Dibdin, the club being formed at a dinner given to celebrate the purchase by the Duke of Marlborough of the Valdarfer 'Boccaccio' (Venice 1471) for the sum of £2,260. The club had 24 members, and its object was to pledge its personnel to the re-printing of rare volumes. It was the first club of this order and is still in existence, the Dilettanti Society being on the same order, and with it forming the forerunners of the modern publishing societies.

ROXBURY, rôks'bûr-î, Mass., now a part of the city of Boston, annexed in 1867. It has a diversified surface, a remarkable alternation of hill and hollows, which afford picturesque building sites, and which have made a great portion of Roxbury a residential section. There are a number of manufactories, among which are cotton and woolen mills, machine shops, cordage and carpet factories and organ works. A free Latin school was established in Roxbury in 1645. The place was for many years the scene of the labors of John Eliot (q.v.), the "Apostle of the Indians," and his remains are in the "ministers' tomb" in the old burial ground. It is also the birthplace of Joseph Warren (q.v.) of Revolutionary fame. The township of West Roxbury, which contained the villages of West Roxbury and Jamaica Plain, was set off from Roxbury in 1852. When Roxbury was annexed to Boston it had a population of about 40,000.

ROY, roi, Joseph Edward, Canadian author: b. Lévis, Quebec, 7 Dec. 1858; d. 1913. He was educated at Laval University and entered the Dominion Public Service in 1880. From 1908 he was attached to the Bureau of Archives, Ottawa; and with his brother he founded the *Bulletin des Recherches Historiques*, to which he contributed extensively. Author of 'Le Premier Colon de Lévis'; 'L'Ordre de Malte en Amérique'; 'Jean Bourdon et la Baie Hudson'; 'L'Ancien Barreau au Canada'; 'Histoire de la Seigneurie de Lauzon' (5 vols.); 'Rapport sur les Archives de France'; 'Essai sur Charlevoix,' etc.

ROYAL, roi'al, Joseph, Canadian journalist and editor: b. Repentigny, Quebec, 1837; d. Montreal, 23 Aug. 1902. He was educated at the Jesuit College of Saint Mary's, Montreal, and engaged in journalism. He founded *Le Nouveau Monde* in 1857, and *L'Ordre* in 1859; and in 1864 was one of the founders of the *Revue Canadienne*. He was admitted to the bar in 1864, and 1870 settled in Manitoba, where he founded *Le Metis*, and also engaged in law practice. He served in the Manitoba legislature in 1870-79 and was successively speaker provincial secretary, attorney-general and minister of public works. He secured the abolition of the legislative council and the establishment of the University of Montreal. He

was elected to the Canadian Parliament in 1888, and in 1889-93 was lieutenant-governor of the northwest Territories. From 1893 he edited *La Minerva* at Quebec. Author of 'Histoire du Canada, 1841 à 1867' (1909).

ROYAL ACADEMY OF ARTS, The, a British institution for the encouragement of painting, sculpture and designing; founded in 1768 by George III, with Sir Joshua Reynolds as president. It is composed of a president (P.R.A.), 40 academicians (R.A.) and 20 associates (A.R.A.), which include professors of painting, architecture, anatomy and perspective. It holds an annual exhibition open to all artists, at Burlington House, London, of paintings, sculpture and designs which reach a certain standard of merit.

ROYAL ACADEMY OF MUSIC, London, England, an institution established in 1823, mainly through the exertions of Lord Burghersh (afterward Earl of Westmoreland), and incorporated by royal charter in 1830. The purpose for which it was founded was to afford a first-class musical education in the various branches of music. It receives a grant from the government, and from this and other sources is able to award to successful competitors a large number of scholarships and prizes. Instruction is given in musical composition, singing and instrumental playing. Concerts are given at intervals by the pupils. Connected with the R.A.M. are associates, fellows and licentiates, besides honorary members. Among its principals have been Sir George Mcfarren and Sir A. C. Mackenzie.

ROYAL ACADEMY OF SCIENCE, The, a Danish institution in Copenhagen, established by the king of Denmark in 1743. It has published transactions ('Skifter') since its foundation, and memoirs ('Afhandlinger') since 1823.

ROYAL ACADEMY OF SCIENCES, The, a German institution in Berlin, founded by Frederick I in 1700; had Leibnitz as its first director, and held its first meetings in 1711. It is divided into four sections, devoted to mathematics, physics, philosophy and history. It publishes memoirs and monthly reports.

ROYAL ACADEMY OF SCIENCES, The, a Swedish institution, known also as the Royal Swedish Academy, founded in Stockholm as a private society in 1739; incorporated under its second name in 1741; issues annual volumes of 'Transactions,' which were at first published quarterly.

ROYAL AIR FORCE, the official name of the aviation service of the British army and navy, promulgated in March 1918, in accordance with the Air Force (Constitution) Act, 1917, providing that "it shall be lawful . . . to raise and maintain a Force, to be called the Air Force, consisting of such numbers of officers, warrant officers, non-commissioned officers and men, as may from time to time be provided by Parliament." An Order in Council dated 7 March 1918 decreed that the Air Force be established under the style and title of "The Royal Air Force." The name hitherto in use was the Royal Flying Corps. The measure involves the creation of an air council presided over by a new secretary of state, and endowed with powers similar to those of the Admiralty and

the army council. In regard to discipline, the annual Army Act, subject to certain modifications, will also apply to the Air Force.

ROYAL ARCANUM, The, a fraternal and beneficial society organized, 23 June 1877 at Boston, Mass., by Dr. Darius Wilson and John Andrew Cummings. The original council in Boston had but nine members. Other councils were soon established in the same city and the order spread rapidly throughout the New England States. It increased at a rapid rate and now there are councils in every State and in almost every city and town in the Union. The business of the order is conducted in Boston, where the society owns a substantial building, in which the supreme council meets. The society is governed through councils which are dominated by the supreme council or governing body. The membership qualifications are good health and character; and the age limit is between 21 and 55. Benefit certificates are issued for \$1,500 and \$3,000, payable at the death of a member. Should a member desire to increase his insurance over the limit fixed by the society he can do so by making application for the increase in the Loyal Additional Benefit Association, formed in 1889, practically within the Royal Arcanum and incorporated in 1890 under the State laws of New Jersey.

The officers of the supreme council or governing body of the society consist of supreme regent, supreme vice-regent, supreme orator, sitting past supreme regent, supreme secretary, supreme treasurer, supreme auditor, supreme chaplain, supreme warden, supreme sentry and legal adviser. The grand councils and subordinate councils have a similar roster of officers.

From 1898 to 1903, its greatest period of growth, the membership according to official data, attained the following figures:

	Membership	Grand councils	Subordinate councils
1898.....	193,573	22	1,762
1902.....	249,644	27	2,004
1903.....	258,746	28	2,045

For the same period the total number of deaths and the total amount of benefits paid were as follows:

	Number of deaths	Amounts paid
1898.....	16,479	\$47,886,199
1902.....	25,714	73,817,678
1903.....	27,480	76,190,352
Emergency fund 31 Oct. 1902.....		1,813,141
Emergency fund 28 Feb. 1903.....		1,885,786

Rates of assessment being too low to cover all expenses and ensure permanency the society at times has had to readjust its financial policy with the result that a firm foundation has been established which actuaries and insurance experts confirm as safe and sound. According to recent figures the status of membership, deaths and benefits paid, was:

YEAR	Member-ship	Grand councils	Deaths	Amounts paid
1918....	143,042	32	1,619	\$6,600,337 27
Emergency fund 30 April, 1918.....				4,341,675 44

The emblem of the association is a royal crown in a circle, on the circumference of

which are 10 small Maltese crosses with the motto, "Virtue, Mercy and Charity."

ROYAL ARCH MASONS. See MASONIC FRATERNITY.

ROYAL BLACK ENCAMPMENT OF ISRAEL. See ORANGEMEN.

ROYAL COLLEGE OF MUSIC, London, England, an institution established in 1883 in South Kensington under the presidency of the Prince of Wales, afterward Edward VII. It was endowed at its commencement by gifts to the amount of \$630,000. Pupils of either sex are admitted either as fee-paying students or as scholars or exhibitioners. There are 52 open free scholarships and 11 close free scholarships, besides the council exhibitions, the Savage Club exhibition, the exhibitions of the associated board of the Royal Academy of Music (q.v.) and the Royal College of Music, etc. Prizes and medals are also awarded to the students in accordance with the results of examinations. The associateship may be obtained by outsiders as well as pupils on passing a qualifying examination, and entitles the holder to use the initials A.R.C.M. The professorial staff includes several eminent names.

ROYAL CROWN OF HAWAII, Order of. See ORDERS, ROYAL.

ROYAL ECONOMIC SOCIETY, incorporated 1902, was formerly known as the British Economic Association, a society established in London in 1890 with the design of advancing economic investigations through the medium of a quarterly styled *The Economic Journal*. This periodical is the most valuable one of its class and is open to the expression of very diverse views upon economic questions. Viscount Goschen was the president of the association from its founding until his death in 1907. He was succeeded by Lord Haldane. It gives an annual dinner in London, but holds no regular scientific meetings.

ROYAL FAMILY, The, in its widest sense, as referring to Great Britain, embraces all the British descendants of the royal house; in its narrower sense it includes only the queen-consort and queen-dowager, with all the lineal descendants of the sovereign. The husband of a queen-regnant is not as such a member of the royal family. The members of the royal family have precedence over all peers and officers of state; but an heir-presumptive has no rank or precedence as such, as his position may be altered by the birth of an heir-apparent.

ROYAL FERN. See OSMUNDA.

ROYAL FLYING CORPS (R. F. C.), the aeronautical branch of the British armed forces. The title originated in March 1912.

ROYAL GEOGRAPHICAL SOCIETY. See GEOGRAPHICAL SOCIETY, ROYAL.

ROYAL GEORGE, English man-of-war, sunk in Portsmouth Harbor, England, 29 Aug. 1782. While undergoing repairs at the keel the vessel suddenly careened and filled with water, going down with all on board. The ship, the principal vessel of Lord Howe's fleet, was commanded by Admiral Kempenfeldt, and carried about 1,100 persons, including nearly 300 women and children. The disaster was commemorated in an elegy by Cowper, 'The Loss of the Royal George.' The first attempt to raise the vessel was made in 1817; but it

was not until 1839 that portions of the ship and its cargo were brought to the surface, when the sunken mass was exploded by means of great quantities of gunpowder.

ROYAL HISTORICAL SOCIETY, an English society founded in 1868 for the purpose of promoting and fostering the study of history "by assisting in the publication of rare and valuable documents, and by the publication from time to time of volumes of Transactions and Publications." The Society was incorporated 31 July 1889 and has since enjoyed the patronage of the sovereign. The Camden Society was amalgamated with it 2 May 1897 and the Camden Series of publications was transferred to it. The Society consists of president, ordinary fellows, honorary fellows and corresponding members, and is open to international membership; the honorary fellowships are limited to 75, of which only 25 may be British subjects. The membership is about 700, and in 1917 it had published 195 books and manuscripts besides the 57 published by the Camden Society in its separate existence, 1838-97.

ROYAL INSTITUTION OF GREAT BRITAIN, an institution founded in 1799 by Count Rumford, Sir Joseph Banks and other men of science, and incorporated in 1800. It was reconstituted on a wider basis in 1810, and has for objects the promotion of scientific and literary research, the teaching of the principles of experimental science, the exhibition of the applications of these principles to the arts, and the affording of opportunities for study. Many distinguished chemists and physicists have conducted their researches in the laboratories. The library contains some 60,000 volumes.

ROYAL LION, Order of. See **ORDERS**, ROYAL.

ROYAL LOUIS ORDER, The. See **ORDERS**, ROYAL.

ROYAL NAVAL COLLEGE OF CANADA, an institution for training cadets for the navy. Entrance examinations are held in May at the appointed centres of the Civil Service Commission. The Civil Service Commission, Ottawa, furnishes on application blank forms for admission and information of requirements and dates and places of examination. The examination fee is \$4. The age of admission is from 14 to 16 years and each candidate undergoes a medical examination for physical soundness and fitness, besides the educational examination in arithmetic, algebra, geometry, geography, history, writing and dictation and either French or German. Additional marks may be obtained on two of four optional subjects—Latin, elementary science, drawing or a second modern language. The college course extending over three years comprises: mathematics, navigation, mechanics, physics, chemistry, engineering, seamanship, pilotage, English, French or German, geography and history (including naval history). Each cadet pays annually—in advance—a fee of \$100 and in addition a fee of \$350 for the first year and \$225 for each succeeding year. These fees cover tuition and living expenses, including furniture, bedding, mess equipment and table board. There are vacations of six weeks at Christmas and six weeks in summer. By arrangement, graduates

of the college are admitted to the second year of the course of applied science in McGill University, or the University of Toronto, entrance for which is obtained through competitive examinations. Candidates must be British subjects and they or their parents must have resided in Canada for two years immediately preceding the examination. Absence abroad for schooling during a short period may be considered as residence in Canada. The Dominion Department of the naval service does not require cadets to adopt a naval career and does not commit itself to issue commissions to graduates of the Naval College. The British Admiralty accepts each year eight cadets who have completed their course at the college, if these cadets have attained the required standard of efficiency, and they are entered in the Royal Navy as cadets of the same standing as graduates of the Dartmouth Naval College. The college was opened at Halifax, Nova Scotia, in January 1911. Owing to the partial destruction of the college buildings at Halifax in the disastrous explosion of 6 Dec. 1917, temporary quarters were located in the Royal Canadian Naval Dockyard at Esquimalt, British Columbia, pending a decision for the definite location of permanent college buildings.

ROYAL OBSERVATORY, Greenwich, England, the famous observatory established by order of Charles II, who appointed John Flamsteed astronomical observer 4 March 1675 at a salary of £100 (\$500), for which he was also to instruct two boys from Christ's Hospital. The first observation was made 19 Sept. 1675. The observatory was established to meet the requirements of navigation and not only has amply fulfilled its object, but under the distinguished successors to Flamsteed has contributed to the higher branches of science, some of the most important of the astronomical and physical discoveries of modern history. Among the directors of the observatory have been Edmund Halley (1720-42); James Bradley (1742-62); Nathaniel Bliss (1762-65); Nevil Maskelyne (1765-1811); John Pond (1811-36); Sir George Airy (1836-81); Sir William Chrystie (1881-1910); Dr. Frank Watson Dyson (1910). The director of the observatory is styled the astronomer royal, and is under the official control of the Admiralty, but receives his appointment directly from the Prime Minister, and holds office by warrant under the royal sign manual. The largest instrument is a 28-inch refractor, with spectroscope attached. Another fine instrument is the astrographic equatorial designed for work in connection with the "Photographic Chart of the Heavens." It consists of two telescope tubes rigidly connected and parallel, one carrying a 10-inch telescope lens, the other a 13-inch photographic lens by which the star images are imprinted on the photographic plate. The Greenwich section of this important work was completed at the end of 1909. The Thompson equatorial, presented to the observatory by the late Sir Henry Thompson, has on one side of the declination axis a telescope with a lens corrected for photographic rays of 26 inches aperture, and on the other side a telescope with a mirror of 30 inches diameter. A photographic spectroscope is mounted on the reflector. The refractor is being used to determine the distances of stars. Photographs of the sun are taken on every

available day, and after being measured are carefully stored for reference, giving a daily record of sunspots for the last 35 years. The chronometers used in the navy are purchased after "trial" at the observatory. The average number being tested daily is about 600. Every hour during the day time-signals are sent out from the standard "motor clock" of the observatory through the postal telegraph service, giving Greenwich time to all parts of the United Kingdom. The true basis of accurate astronomy was laid by James Bradley's observations of 3,222 stars at Greenwich; the observatory has the 24-inch reflector by which the satellites of Uranus and Neptune were discovered by Lassell; and at Greenwich in 1908 the eighth satellite of Jupiter was photographically discovered by Melotte. *Astronomical Observations* founded 1750 and published annually since 1838 contains a continuous record of the moon's position since 1750. At Greenwich in 1767 Nevil Maskelyne founded the *Nautical Magazine*. The observatory staff consists of the director, two chief assistants, six assistants and a staff of computers. See OBSERVATORY.

ROYAL ORDER OF VICTORIA. See ORDERS, ROYAL.

ROYAL ORDERS. See ORDERS (ROYAL) AND DECORATIONS OF HONOR.

ROYAL AND PROTESTANT ORDER OF SAINT JOHN. See ORDERS, ROYAL.

ROYAL SOCIETY OF EDINBURGH, a society which was incorporated in 1783, having been developed from the Philosophical Society of Edinburgh, commenced in 1739. Among its early members were Hume, Reid, Edmund Burke, Hutton, Dugald Stewart and James Watt; and among its presidents have been Sir Walter Scott, Sir David Brewster, the Duke of Argyll, Lord Moncrieff and Sir William Thomson.

ROYAL SOCIETY, London, an organization which owes its origin to a club of learned men who were in the habit of holding weekly meetings in London as early as 1645, although the year 1660 is generally given as the year of its foundation. Charles II took much interest in the proceedings of the Society, and in 1682 granted a charter to the "President, Council and Fellows of the Royal Society of London for Improving Natural Knowledge." Lord Brouncker was first president of this incorporated Royal Society. Meetings are held weekly from November to June for the purpose of reading and discussing scientific papers; and the more important of these are published in the annual "Philosophical Transactions," first issued in 1665, and now forming a most valuable series. Accounts of the ordinary meetings, with abstracts of papers, etc., appear also in the periodical "Proceedings," begun in 1800. Scientific research has at all times been both initiated and encouraged by the Royal Society, and many of the most important scientific achievements and discoveries have been due to its enlightened methods. It deservedly enjoys an influential and semi-official position as the scientific adviser of the British government, and not only administers the \$20,000 annually voted by Parliament for scientific purposes, but has given suggestions and advice which have borne valuable fruit, from the voyage of Captain Cook in the *Endeavor* in 1768

down to the *Challenger* expedition, more than a century later. The society has an independent income.

ROYAL SPANISH ACADEMY, The, an institution established at Madrid in 1714 for the same purposes as the French Academy. The number of members is limited to 24.

ROYAL UNIVERSITY OF IRELAND. See NATIONAL UNIVERSITY OF IRELAND.

ROYALL, roi'al, Isaac, American soldier: b. Massachusetts, about 1720; d. England, October 1781. He was a wealthy citizen of Medford, was its representative for many years in the General Court, and for 21 years was a member of the executive council. He served in the French War, and in 1761 was appointed brigadier-general, the first resident of New England to attain that rank. At the outbreak of the American Revolution he remained loyal to the Crown, and in 1775 left the country. His estates were confiscated and he was proscribed in 1778, but seems to have borne no enmity to his native land, as he bequeathed 2,000 acres of land in Worcester County to found a law professorship at Harvard, and made various other patriotic bequests. The town of Royalston, of which he was one of the original proprietors, was named in his honor, and the chair of law was established in his name at Harvard in 1815.

ROYCE, rois, Charles C., American naval officer and historian: b. Defiance, Ohio, 22 Dec. 1845. During the Civil War he was an officer in the United States navy; from 1866 to 1876 was an official of the United States Indian Bureau and of the Bureau of Ethnology of the Smithsonian Institution from 1876 to 1885. During the 47th Congress he was secretary to the speaker of the House of Representatives. In 1908 Mr. Royce was elected junior vice-commander-in-chief of the Grand Army of the Republic by the National Encampment. He has published 'A History of the Cherokee Nation of Indians'; 'History of Indian Land Cessions to the United States'; 'The Indian Title: the Method and Chronology of its Extinction'—all published by the Bureau of Ethnology. He also wrote 'An Inquiry into the History and Identity of the Shawnee Indians'; and 'Biography of General John Bidwell, one of the Earliest of the California Pioneers.'

ROYCE, Josiah, American philosopher and educator: b. Grass Valley, Nevada County, Cal., 20 Nov. 1855; d. Cambridge, Mass., 14 Sept. 1916. Graduated (1875) at the University of California, he studied also at Leipzig and Göttingen (1876) and the Johns Hopkins University (1877-78), and in 1878-82 was instructor in English in the University of California. From 1882 to 1885 he was instructor in philosophy at Harvard, in 1885 was appointed assistant professor, and in 1892 was elected to the professorship of the history of philosophy, which he still retains. His views are very similar to those of T. H. Green (q.v.), the great English representative of the Neo-Kantian or Neo-Hegelian movement, and his position may be studied in the historico-critical work, 'The Spirit of Modern Philosophy' (1892). His clear, distinguished style as writer and lecturer has served to enhance his reputation in the United States, among whose leaders in philo-

sophic inquiry he is highly ranked. Besides 'California from the Conquest to the Vigilance Committee of 1856' (1886), and 'The Feud of Oakfield Creek' (1887), a work of fiction, he has written 'A Primer of Logical Analysis' (1881); 'The Religious Aspect of Philosophy' (1885); 'The Conception of God' (1897); 'Studies of Good and Evil' (1898); 'The Conception of Immortality' (1900; Ingersoll lecture on immortality, 1899); 'The World and the Individual' (1900-01; Gifford lectures, 1899-1900); 'Outlines of Psychology' (1903); 'Herbert Spencer' (1904); 'Philosophy of Loyalty' (1908); 'William James and other Essays on the Philosophy of Life' (1911); 'Sources of Religious Might' (1912); 'The Problem of Christianity' (2 vols., 1913); 'War and Insurance' (1914); 'The Hope of the Great Community' (1917).

ROYCROFTERS, roi'krōf-térz, *The*, the name applied to a colony of artisans and artists living at East Aurora, Erie County, N. Y. The founder of the Roycroft colony was Elbert Hubbard (q.v.), who in 1893 established here a printing establishment and a monthly period called *The Philistine*. Hubbard, imbued with a socialistic doctrine similar to that of William Morris (q.v.) of England, gradually gathered about him numerous kindred spirits, and since 1900 the Roycrofters have been producing hand-made books, furniture and wrought-iron work, and have established schools of music, painting and sculpture. There are numerous workshops, a library, church and other buildings at East Aurora, occupied by the Roycrofters, who have increased until the colony numbers several hundred.

ROYER-COLLARD, rwā-yā-kō-lār, Pierre-Paul, French statesman and philosopher: b. Sompuis, Marne, 21 June 1763; d. Chateauvieux, 4 Sept. 1845. He was educated at the colleges of Chaumont and Saint Omer and later became an advocate in Paris. He was an active participant in the Pre-Revolutionary movement and was elected one of the representatives of the commune of Paris. During the ascendancy of the Jacobins he retired to his native province, where he succeeded in avoiding their suspicions. In 1797 the department of Marne sent him to Paris as a member of the Council of the Five Hundred and there he endeavored to serve the republic. But his sympathies were not with the Napoleonic régime. His correspondence with Louis XVIII begun at this period, which was also marked by his temporary retirement from political life. In 1809 he was appointed to the chair of philosophy in the University of France and later became known as the head of the "doctrinaire" school. At the Bourbon restoration in 1814 he was made Councillor of State and Chief of Public Instruction. In 1827 he was admitted to the French Academy and in 1828 became president of the Chamber of Deputies. In 1842 he retired from public life. He left few published works, but these reveal him as at all times on the side of freedom and enlightenment. In the support of the house of Bourbon he sought the overthrow of an empire which seemed to him to have usurped greater privileges than those of the monarchy it supplanted. His biography has been written by Barante (1878), Spuller (1895)

and Vingtain (1858). For an outline of his philosophy consult Jouffroy's translation of Reid.

ROYERSFORD, roi'érz-férd, Pa., borough of Montgomery County, on the Schuylkill River, 30 miles northwest of Philadelphia, on the Pennsylvania and the Philadelphia and Reading railroads. There are stove foundries, machine shops, bottle works and silk factories. Pop. (1900) 2,607; (1910) 3,073.

ROZE, rōz, Marie, French opera singer: b. Paris, 2 March 1850. She was a favorite opera singer of Paris for many years. Her first appearance in London was in 1872. There she was received with favor also and sang in Italian opera during the next four years. She was married to Mr. Mapleson, her manager, in 1897 and sang for two years in America, when she returned to the London operatic stage.

RUATAN, roo-ā-tān', or **ROATAN**, rō-ā-tān', an island of Central America, in the Bay of Honduras, is 30 miles long by 10 miles wide. Its coast has dangerous reefs, except at the south, where there are a few good roadsteads, and at the east, where there is one, called Port Royal, which is ample and deep, though difficult of access. The soil is fertile and the cocoa-palm, figs and vines grow without cultivation, while vegetable growth is abundant. Ruatan has three dependencies, Bonaca, Utila and Barbareta, comprising the colony of the Bay Islands. These islands were ceded to Honduras in 1856 by Great Britain. Pop. from 2,000 to 4,000.

RUBÁIYÁT (roo-bī-yāt') OF OMAR KHAYYAM. The collection of quatrains known as the 'Rubá'iyát of Omar Khayyám,' owes its fame less to its author, the astronomer-poet of Persia, than to its translator or adapter, Edward FitzGerald, whose version has become one of the monuments of English literature, and the inspiration of innumerable imitations and parodies.

The original author, Ghiás 'uddin Abul-Fath Omar ibn Ibrahim-al-Khayyám, was born in Naishápúr, Persia, early in the 11th century A.D.—some hold as early as 1020—and died at a ripe old age about 1123. He was a man of profound learning, by profession a mathematician and astronomer, one of eight scientists chosen by the Sultan Malik-Shah to reform the Mohammedan calendar. No less was he a philosopher, poet and humorist, a man of bold and independent thought and many-colored fancy; and in his leisure moments he embodied his varied reflections in stray quatrains that have come down to us as the 'Rubá'iyát of Omar Khayyám.' The word 'rubá'i-yát' simply means "quatrains," being the plural of 'rubá'iy.' The rubá'iy is a complete poem of four lines, the first, second and fourth lines rhyming, complicated triple, quadruple and even quintuple rhymes being employed. The third line is usually, but not always, left unrhymed. There exist in various Persian manuscripts about 1,200 rubá'iyát attributed to Omar, not more than 500 of which are considered authentic by even the most generous critics. These rubá'iyát, each presenting a distinct thought and unrelated to any other rubá'iy, appear in the Persian manuscripts arranged alphabetically according to the terminal letters of the rhymed lines. Edward FitzGerald, in cre-

ating his remarkable English version first published in 1859, not only selected, combined and remolded such *rubá'iyát* as appealed to his genius, but also arranged them so as to produce an effect of continuity of thought wholly lacking in the original. He thus evolved a meditative poem or elegy of marvelous melody and power, emphasizing, however, one phase of Omar's thought to such a degree that a contemporary wrote, "The *Rubá'iyát* will come in time to be recognized as the highest expressions of agnosticism."

The philosophy of the *Rubá'iyát* as presented by FitzGerald is in effect: "We know the loveliness of this world, we know nothing of the Hereafter; but God, who created us as we are, will not punish us for being as He made us; let us then enjoy the only life of which we are sure, before we inevitably pass into darkness." Without denying that this may be considered the old Persian's dominating thought, it must be added that Omar, being at least nominally a Mohammedan, had his moments of piety, and never wrote anything as daring as Stanza LXXXI of FitzGerald's version. Some have even maintained that Omar was a devout member of the Sufi sect, and insist on allegorical and religious interpretations of his praises of wine and beauty. But we are safest in considering the quatrains as expressions of the conflicting moods of an essentially human personality.

FitzGerald's version in the author's fourth and final edition contains 101 quatrains. There are numerous other more extensive and more literal, though far less delightful translations in French, German, English, Hungarian and Norwegian. Several of these translations may be found, presented with FitzGerald's work, in the '*Rubá'iyát of Omar Khayyám*' (Multi-Variorum ed., edited by Nathan Haskell Dole, Boston).

ARTHUR GUITERMAN.

RUBBER, an elastic, resilient substance derived from numerous trees and vines found scattered widely over the tropics. Its proper name is *Caoutchouc* and it is classified in the hydro-carbon family; the chemically pure product being described by the symbols $C^m H^n$. Commercially pure rubber, however, contains several other things such as moisture, albumin, resin, sugar, mineral matter and oil. The discovery of rubber is attributed to Columbus who, as the story goes, found the natives of Hayti playing a game of ball with a resilient, bouncing material. Later voyagers from France on a mission involving certain geographic surveys made a closer analysis of this substance including in their reports a rather detailed description. One main fact brought to light by these men was that *Caoutchouc* was derived from a lacteal fluid and not from the sap of the trees as is, even now, commonly supposed. See **INDIA RUBBER**; **INDIA RUBBER TREE**.

Caoutchouc is the term used to describe this substance in all but the English-speaking countries. The term "rubber" is the result of a discovery by Priestly, an Englishman, who in 1770, by experiment, found that small pieces of this coagulated latex were useful as pencil mark erasers. He immediately called them "rubbers" and for the want of a more descriptive one, this name rubber remained; until now

it is accepted by all English-speaking people as descriptive of the crude material, which forms the basis of so many manufactured articles now classified as rubber goods.

Although Latin countries first interested themselves in rubber, particularly France, Portugal and Spain, and many items of native manufacture were exported from Brazil and other South American colonies to these countries; these, however, were looked upon simply as interesting curiosities and it fell to the English to really begin manufacture of rubber goods on a scientific basis, following extensive research work. The first patent covering rubber for practical use was issued in 1771 to Samuel Peal of London. His invention provided for the waterproofing of cloth by spreading it with a thin layer of melted rubber. This process was, however, attended by so many difficulties that Peal did not make progress and although the experiment doubtless served as a stimulant for further research and development, in itself resulted in nothing.

Next came Nadier, also an Englishman, who in 1820 patented the idea of manufacturing elastic thread by cutting thin strips from long slabs of rubber. These he intended should be woven into cloth. But his invention, likewise, proved impractical as it was then found impossible to design weaving machinery which would accommodate elastic thread. Three years after the failure of the elastic thread project of Nadier, Charles McIntosh of Glasgow, Scotland, obtained a patent for waterproofing fabrics. His process was accomplished by spreading a solution of coal-tar naphtha and rubber on a marble slab, allowing the solvent to evaporate. This resulted in a thin sheet of pure rubber which later was placed between two fabrics and fastened by means of needle and thread. In 1825 McIntosh established a factory for the manufacture of garments by this method. McIntosh's venture is regarded by many as the beginning of our modern rubber industry. The name still sticks—all garments of the double fabric texture variety, with rubber between, are still known universally as McIntosh's.

Three years prior to McIntosh's discovery, Thomas Hancock had also interested himself in the possibility of commercially developing rubber. Having spent his early days in mechanical pursuits, Hancock attacked the problem from an entirely different angle. That is, he worked out methods of preparing rubber through the application of machinery and by this means founded what is the real beginning of rubber manufacturing. His first patent granted in 1820, provided for improvements in the application of articles of dress such as wrist bands, waist and coat bands, garters, etc., by the introduction of rubber, that these might be rendered elastic and better fitting. To accomplish his purpose he worked out and designed the first rubber milling machinery. The compounding of rubber with other ingredients was also successfully inaugurated by Hancock. In fact, as early as 1825 he was mixing with rubber, coal-tar, Fuller's earth and coloring pigments for the purpose of strengthening, beautifying and making his products less sticky. He had considerable success in the manufacture of a varied line of rubber goods which, even now, would

be considered fairly complete. His output included hose, belting, packing, shoes, inflated goods and also molded articles such as bumpers. Thus, it can be said that the manufacture of rubber goods really had its inception in England.

Although, in 1813 a patent was granted to Jacob Hummel, of Philadelphia, for a gum-elastic varnish, there seems to be no further mention of his product so evidently it was never put into use. Crude rubber and native rubber articles, such as shoes, water bottles, etc., were, however, brought to the seaports of New England in large quantities as early as 1823 and formed the inspiration for experimentation by a great many Americans who also had ideas for manufacturing rubber into various items of commerce. About 1831, McIntosh and Hancock, in England, began to manufacture a varnish by dissolving rubber and lamp black in spirits of turpentine. This was supposed to provide a waterproofing material suitable for use in the manufacture of footwear and coats. The Roxbury India Rubber Company, of Connecticut, was chartered in 1833 for the manufacture of footwear and clothing under this patent. Following this, small rubber factories sprung up all over New England but none attained success because they failed to take into consideration the nature of the material with which they were working, viz., its tendency to soften and stick in warm temperatures and become hard and brittle under the influence of cold. Among the prominent factories which had failed about 1838 was one in Woburn, Mass., which shut its doors early in the summer of this year leaving Nathaniel Hayward as caretaker. Hayward, having little to do and being of an investigating turn of mind, used the materials at hand for experimentation. During his experiments he happened upon the idea of mixing a small amount of sulphur with rubber and treating the mixture with acid gas fumes, the latter idea having previously been worked out by Charles Goodyear. Hayward patented this process, acknowledging in his application the use of the Goodyear acid gas treatment. Charles Goodyear was a native of Connecticut and son of an importer and manufacturer of buttons, hardware and farm implements. At the time Goodyear's interests were aroused in rubber, he was engaged at Philadelphia in operating the first retail hardware store in the United States and had amassed from this business a considerable fortune. Hearing of Hayward's invention, he promptly purchased from him the patent rights. Thus began the trials of the man whose devotion to an idea has made the great rubber industry possible.

The sulphur and acid gas treatment did not work well as he supposed it would and it was not until the winter of this same year that Goodyear made the final discovery of the process of vulcanization. Although an educated man, he was not versed in analytical chemistry and his discovery was made by exploration into the field of the unknown rather than by experiment. He had mixed sulphur with rubber and while discoursing on the subject so dear to his heart one cold night, so the story goes, a piece which he had in his hand accidentally touched the red hot door of the kitchen

stove. To the astonishment of Goodyear, an ounce or two which stuck on the stove hardened without melting. He rushed to the other side of the room, seized a knife and scraped the residue from the stove while his relatives and neighbors looked on with the conviction that he had finally gone insane. Scraping the residue from the stove and washing it he found "vulcanized rubber." Thus, by chance, Goodyear discovered the vital link which now makes possible the use of automobiles and thousands of other machines.

Goodyear was entirely out of funds through bad credits extended by the hardware business and his devotion to rubber experimenting. It was not until 1844 that he finally applied for and was granted a patent on his discovery. Even then he had great difficulty in convincing others that this was not a myth, the same as they had found his acid gas process to be.

Laverett Candee is said to have been the first to take practical advantage of Goodyear's discovery. He, at least, bought a license from Goodyear to manufacture footwear the same year the patent was granted. From the start rubber shoes were found to be well adapted for hard service and sales made a slow but substantial growth. The success of Candee caused many others to enter the business of rubber manufacture and within a comparatively few years there were several concerns turning out a variety of products. Among the first were, Ford and Company of New Brunswick, N. J.

The path of the American rubber manufacturer, in spite of the assured success of rubber goods through the discovery of vulcanization, was not, however, one of ease and affluence. Many difficulties attended the establishment of rubber factories that were not of a mechanical nature. Tariff reforms were needed badly. Our monetary system was in a state of flux; other industry as a consequence was at a low ebb. Accordingly, the demand for rubber goods did not exist. In fact it was not until after the close of the Civil War that rubber manufacture, through the improved industrial condition of the United States and the development of railroads, began to come into its own.

Goodyear died financially discredited, leaving no legacy to his heirs in the way of participation in the fruits of his efforts, although credited with having made a great fortune from his discovery. He spent money lavishly in advertising; in fact, during the year 1851 he made an impressive exhibit of American made rubber goods at the Crystal Palace (London) exhibition where he contracted more debts than he could conveniently meet and was thrown into prison. Many infringements were made and he was called upon repeatedly to sustain his patent claims in court. This took a great deal of money.

The Civil War had furnished the impulse toward a general industrial expansion in the United States and development of transportation carried manufacturing further West.

Rubber manufacture was established west of the Allegheny Mountains and thus we have what is known as the beginning of the Rubber Era. As Hancock had shed light upon the possibilities of rubber as an every-day commodity; as Goodyear had discovered the means

for making these ideas realities; so Dr. Benjamin Franklin Goodrich developed the channels through which dreams and discoveries of his predecessors were able to be enjoyed by men in all walks of life. It was he who blazed the trail of practical manufacture and first demonstrated the real scope of rubber manufacture in the central west, which resulted in opening up one of the leading industrial cities in the United States. Dr. Benjamin Franklin Goodrich became involved through a real estate transaction in the Hudson River Rubber Company of Hastings, N. Y., a concern which had made a failure. Like Goodyear he became intensely interested in the future of rubber; so much, in fact, that he gave up his real estate interests to make rubber manufacturing his life profession. He came west seeking capital and landing in Akron sold himself and his defunct New York Rubber Company to the prominent members of the Akron Chamber of Commerce. In 1870 the machinery was moved to Akron, the original company being incorporated 31 December. The building occupied was a two-story brick structure, 50 by 100 feet and 20 people constituted the entire pay-roll. The first products consisting of hose, billiard cushions and belting were placed upon the market in May 1871. Thus, from a 20-man beginning, Akron, Ohio, has developed into the rubber manufacturing centre of the world. In normal times something like 65,000 workmen are employed in turning out about \$300,000,000 worth of rubber goods—over one-third of the production of the whole United States.

No hard-and-fast rule can be laid down by which to classify rubber products. There are, however, to-day 12 general divisions of manufacture and sales which are quite generally recognized both from the standpoint of manufacturing and marketing. While several lines are often sold through the same factors the problems of selling the different lines are somewhat diversified, and hence the necessity for continuing the classification into the sales end of the business. These lines are, viz., footwear, mechanical rubber goods, rubber sundries, insulated wire, hard rubber items, solid tires, pneumatic tires, auto accessories, tire repair materials, rubberized fabric products, dipped goods and lathe cut items.

The rubber business in America can be said with truth to have begun with the rubber shoe in 1823. A few pairs were at that time brought to Boston by a sea captain, plying between the ports of South America and New England in the rum trade. During 1825, 500 pairs of crude native-made rubber shoes were brought to Boston and found a ready market. Although thick and clumsy, being made from the raw unvulcanized gums, these readily sold for from \$3 to \$5 per pair. Although having many drawbacks as an item of wearing apparel, they were, nevertheless, waterproof; and, being a curiosity, found a ready market among the rich. The following 15 years probably saw 1,000,000 pairs of these crude rubber shoes brought into the United States and all found ready sale. When, however, the mechanical process of rubberizing fabric with a varnish of spirits of turpentine, lamp black and rubber made possible the construction of rubber shoes on a factory basis the popularity of rubber

shoes died out. The shortcomings of unvulcanized rubber then became more generally recognized, i.e., its tendency to viscousness in warm and its brittleness in cold weather and The Roxbury India Rubber Company, established in 1833, for the manufacture of shoes after this plan, met with ignominious failure in less than three years.

Immediately after Goodyear's discovery of vulcanization, L. Candee, who purchased the first license to manufacture rubber goods under this patent, repopularized the rubber shoe and put it on the market to stay and this company has continued to the present time as one of the important factors in the American rubber footwear industry. One very important event in the history of the rubber boot and shoe business in the United States occurred in the fall of 1892 when the United States Rubber Company purchased nearly all the larger rubber footwear interests of this country. This centralization resulted in conspicuous economies for while the industrial units of this combination have remained under their former management, they have shared their individual profits in common. The patents and secret processes of one factory became the property of all and in this way all important methods and formulae which each factory enjoyed before were equally shared by the whole organization. There was also a great saving in the matter of crude rubber purchases, the large single purchase being made at great advantage over a number of small scattered purchases. Other advantages also accrued by eliminating the necessity of carrying large stocks and in diminishing the duplication of a large "last" equipment.

The next great step in rubber footwear development came as a result of experiments made by the B. F. Goodrich Company. This company entered the footwear business in 1905, making a line of light-weight wear under a contract for one of the large jobbers. In 1913 the Goodrich Company introduced their *Hi*-press line of heavy boots and shoes made by an altogether new process resulting in a quality far beyond what had been previously possible. In 1916 the Goodrich Company reorganized its footwear manufacturing and sales departments coming out, at that time, with a complete line which they began to market direct to the retailer. In 1917 the Firestone Tire and Rubber Company of Akron also launched a rubber footwear department.

Although for many years the footwear business monopolized the bulk of the crude rubber imports, other lines have now developed to the point where but 8 per cent is utilized by this division. The growth of the rubber shoe business, has, however, been very phenomenal. From an annual output in 1860, valued at \$795,000, the increase has been in leaps and bounds. To show its growth in chronological order, in 1870 the value reached \$8,000,000; in 1880, \$16,000,000; in 1890, \$24,000,000; in 1900, \$40,000,000; in 1914, \$60,000,000 and during 1918 the production reached the grand total of 65,750,000 pairs, worth, approximately, \$125,000,000. Sales during these two years were, however, largely augmented through the necessities of the warring nations for large quantities of waterproof shoes. For 1919 the output will not exceed in value \$100,000,000.

The manufacture of mechanical goods began

with hose and belting; but development in this field has probably been more prolific in invention than in other lines of rubber manufacture. To-day the full mechanical line not only embraces belting and hose but about 30,000 molded items such as bumpers, valve discs, etc. Packing of several kinds for steam engines, etc., is also an important item. Rubber insulated wire of all kinds, floor covering such as matting and tiling, while decklestraps, billiard cushions, etc., are also embraced within this class. To give an idea of the volume of business which is done in rubber mechanical goods the last item (billiard cushions) uses one-fourth million dollars' worth of crude rubber each year and this by no means is the largest single item.

Rubber sundries had their inception many centuries before the discovery of America in the form of native bottles, canteens, etc. Manufacture began, however, with Hancock in England, about 1825. He designed and patented several articles such as water bottles, air cushions, etc. In America the Union Rubber Company of New York can be said to be the first to manufacture sundries under the Good-year patents. They started in business in 1857 and to-day this branch of rubber manufacturing occupies a most prominent place—the volume in sales running up to approximately 10 or 12 million dollars.

Rubber sundries embrace a large number of items. These are usually sub-classified into five divisions such as drug sundries which include hot water bottles, etc.; surgeons' sundries including drainage tubes, operating cushions, etc.; dental sundries including plaster bowls, etc.; stationers' supplies including bands, erasers, etc.; athletic sundries including tennis balls, baseball body protectors and golf balls. Many special items such as respirators are also included in the production of this division.

Insulated wire, although using a comparatively small proportion of crude rubber, is one of the most important divisions of the rubber business. Without rubber insulated wire, civilization could not exist as it does to-day. Building cables, automobile cables, mining cables, telephone wire and cables all depend upon the insulating qualities of rubber for their success. In other words, were it not for this rubber insulation, the "juice" would leak away long before it reached its destination. Several millions dollars' worth of this product alone are produced yearly in the United States—the output being confined to relatively few factories.

Charles Goodyear began the manufacture of hard rubber about 10 years after his patent was granted. In 1851 when he made his famous exhibit in London, hard rubber items played an important part in the display. The first article made to any extent was the comb. Goodyear's biographer, a personal friend, relates that the original combs cost 20 times as much as the ivory ones then in use, but only 20 years after this, the India Rubber Comb Company practically enjoyed a monopoly in the business. In 1898 the American Hard Rubber Company, a combination of several small companies, with a capital of \$2,500,000 was organized and captured the bulk of the business. Other independent companies have since entered the field and to-day enjoy a large portion of the business.

Hard rubber differs from the soft product mainly in that there is more sulphur in the compound—the value sometimes reaching 30 per cent—and the cure is longer. Battery jars constitute, perhaps, the largest single item in hard rubber manufacture although the complete list embraces some 15,000 to 18,000 items. These are represented by tubing, steering wheel rims, pipe stems, buttons, fountain pen barrels and a multitude of articles necessary to the success of all sorts of electrical devices. For example, there are on every desk telephone set a dozen or more hard rubber pieces. As may be imagined the value in sales of hard rubber alone is considerable.

In so far as the motor truck is concerned the highway is, in truth, paved with rubber and had it not been for the solid rubber tire, the motor truck would have remained an experiment and the World War might not have been one for democracy. Even before the discovery of vulcanization, ideas were entertained for the reducing of vibration in vehicles by the use of rubber. As early as 1846, the firm of Charles McIntosh and Company of Manchester, England, perfected and manufactured a solid rubber carriage tire for Her Majesty's brougham. The Shrewsbury and Talbot Noiseless Tire and Cab Company, Ltd., of England and Brewster and Company of New York were the first to popularize this solid rubber vehicle tire. This tire was the Carmont, patented in 1881. Following this came the "Cushion," a solid tire with a hollow or sponge rubber centre patented in 1884. The Internal Wire type patented by Grant in 1896 was, however, by far the most popular solid rubber carriage tire made. In 1891, J. A. Swinehart patented what is known as the side wire tire and this is the one which was introduced and first adopted for motor vehicle use. The side wire tire failed in motor vehicle service and the "steel base" type took its place and is the one in use to-day. This type is the outgrowth of experiments made by the B. F. Goodrich Company in 1909 to overcome the difficulties in motor vehicle service attending the use of other types.

The solid rubber carriage tire has largely died out due to clearly evident causes. The volume of business done in solid rubber motor truck tires is, however, astounding. Two and one-half million of tires were produced during 1918 representing in value something like \$25,000,000.

The pneumatic tire was invented by Robert W. Thompson in 1845 for carriage uses but his patent was forgotten and in 1883 Charles Dunlop revived the idea in the form of a bicycle tire. The growth of the bicycle business is well known, but in its palmyest days there were never as many in use as to-day. Approximately 3,500,000 bicycle tires are in service, wearing out yearly one tire each and the average yearly production of bicycles is one-half million.

The pneumatic automobile tire is the outgrowth of the bicycle tire. In fact, the first automobiles were equipped with Tandem weight bicycle tires. The first tire designed exclusively for automobile usage was made in 1896 by the B. F. Goodrich Company for the Winton Company of Cleveland, Ohio. Two sizes were furnished, 34 x 4 and 36 x 4—the former for the front and the latter for the rear wheels of

the machine. The carcass consisted of 19-plies of fabric and the "huge tires" were the source of much amusement for the crowds who witnessed the trial trips of Mr. Winton's "big" machine. To-day the pneumatic automobile tire is, by far, the most important single item of rubber goods manufacture. It is estimated that in 1919 37,500,000 tires will be made, valued at \$1,125,000,000. Practically all of this development has taken place since 1900; a wonderful record. There are two general types of pneumatic tires in use to-day. One is made with a carcass of specially woven long fibre cotton duck and the other is made with a carcass of rubberized cord. This latter type constitutes the acme in resilience and mileage and is much preferred by discriminating motorists.

Automobile accessories comprise such items as water buckets, blow-out patches, inner tube patches (self vulcanizing) and rubber mallets. While the volume in sales of these items is relatively small, yet, many such items are indispensable to the motorist.

The World War taxed the manufacturing capacity of the rubber companies to the limit. This together with the curtailment of crude rubber importation and curtailment in production of tires forced a more economical use of tires and with this a greater tire repair business. During this period, tire repairing received a greater impetus than in all the preceding years of automobile development. This led to an unprecedented demand for repair materials and there is every indication that tire repair materials as furnished by rubber companies will be an important division for all time to come.

Rubberized fabrics are used by the millions of yards in the manufacture of rubber-surface water-proof coats such as worn by firemen, policemen and teamsters and also in the production of numerous special items such as typewriter, adding machine coverings, etc. The balloon business developed almost overnight during the war, called for thousands of yards of rubberized fabric and this necessitated the installation of a great deal of special machinery. This machinery will be turned to other uses and it is predicted that the sale of coated fabric will extend to many new fields. As an indication of this, many automobiles are now using in place of leather, a leather substitute consisting of a fabric coated with a compound held by a binder of rubber. This material is really more durable and can be made in texture and colors surpassing in beauty and design those of leather.

Dipped rubber goods embrace such things as gloves, toy balloons, etc. The volume in sales in this line is not large and but few manufacturers have departments for the production of this class of rubber products. They are made by dissolving rubber in benzene and dipping mandrels in the solution. It is a particularly dangerous process on account of the fumes arising from the solvent and on this account not attractive to the big manufacturer of rubber goods.

Lathe cut goods embrace a great many items such as fruit jar rings, paper mill rolls, feed rolls and certain types of gaskets. These items, especially rubber rolls, both hard and soft, have been in use almost from the be-

ginning of the rubber industry and while the field for usage in this division is somewhat limited, the volume is nevertheless attractive. Several hundred thousand pounds of rubber are used yearly in the making of jar rings alone.

Rubber thread, as worked out from the original idea of Nadier, is usually classified under sundries, although the quantities made generally call for a special department, for its manufacture. Millions of yards are used alone in the production of golf balls. And, in the manufacture of rubber thread for the elastic fabric industry, several hundred people are kept busy in one of Akron's factories.

The total world production of crude rubber has increased more than five fold in the last 20 years. While the production of native or wild rubber has declined considerably, that of plantation has increased since 1900 from a few tons to more than 300,000 tons per year. The bulk of all the crude rubber used now comes from the far eastern area, this embraces the Malay Peninsula, Strait Settlements, Ceylon and other islands. Out of the 290,000 tons used in 1918, 83 per cent came from this district and other plantation areas. Of the 256,879 tons used in the world in 1917, 177,088 tons were consumed by the United States—more than 69 per cent. Out of the 177,000 tons used in the United States, over one-third of this, or 60,000 tons came to Akron, justifying the claim that Akron is the rubber manufacturing centre of the world.

Less than 2,000,000 acres of the plantation areas are, at present, producing. More than 3,000,000 acres are now under cultivation and it is estimated that within four or five years the production of crude rubber on plantations alone will reach the astounding figure of 500,000 tons. Even with this enormous production of crude rubber, the factories would not have been able to keep going, were it not for the fact that three pounds of reclaim to one pound of new rubber are used. In other words, were it not possible to obtain great quantities of high-grade reclaimed rubber to use in places where it will serve the same purpose, the production in rubber goods would be far below what it is at present.

A. R. CHILSON,
Of The B. F. Goodrich Rubber Company,
Akron, Ohio.

RUBBER INDUSTRY IN THE UNITED STATES. The special census of manufactures for the year 1914 reported the number of establishments in the United States engaged in the rubber industry as 342. Of these, seven were making rubber belting; 11 making hose; 23 making boots and shoes, and 301 in other lines—tires, packing, clothing, mats, matting, soles and heels, mechanical rubber, rings for jars, rubber thread, rubberized fabrics and hard rubber articles. In none of these lines was the product of less than \$1,000,000 in value for the year.

The industry occupied 88,821 persons, of whom 74,022 were wage-earners. The total capital employed was \$267,671,422. The value of the raw materials consumed was \$163,034,713, and the value of the year's production was \$300,993,796. Of the 301 establishments engaged in the general manufacture of rubber articles, 54 are in Ohio; 53 in New Jersey; 45 in

New York and 42 in Massachusetts; the remaining 107 being quite widely scattered throughout the country.

The values of the output in the larger branches of the rubber industry for 1914 are as follows:

Automobile tires (casings).....	\$105,678,951
Shoes and rubbers.....	37,858,222
Inner tubes for tires.....	20,101,004
Solid tires.....	13,735,681
Hose.....	16,853,692
Rubber boots.....	12,647,934
Belting.....	7,989,405
Druggists' and stationary sundries.....	7,511,785
Bicycle and aeroplane tires.....	6,905,853
Clothing, ponchos, etc.....	6,799,515
Packing.....	3,507,651
All other.....	40,133,250

The chief division of the rubber industry is the manufacture of tires, the value of its output amounting to 48.6 per cent of the aggregate production of the whole. In 1914 there were 95 establishments devoted to this manufacture, 27 of these being in Ohio and 19 in New Jersey. The solid tire industry is centred in Ohio, where 86.6 per cent of the country's output is produced. The production of automobile tires for the year 1914 numbered 8,021,371 casings and 7,907,351 inner tubes; motorcycle, bicycle and aeroplane tires numbered 3,728,138, and solid tires to the value of \$13,735,681 brought the total value of the tire output for the year up to \$146,421,579.

The rubber industry experienced an enormous expansion during the war. Detailed figures covering this increase are not available, but some comparative idea may be gained from the amounts of crude rubber imported in 1918 as against the importations for 1914. In the calendar year 1914 the amount imported and consumed in the United States was 142,507,294 pounds, valued at \$70,275,840. In the fiscal year ended 30 June 1918 the amount was 390,338,533 pounds, valued at \$203,122,748. Exports in 1914 amounted to a value of \$14,767,513; of which total tires of all descriptions accounted for \$4,963,270; boots and shoes, \$2,780,325, and belting, hose and packing, \$1,807,848. In 1918 the value of the exports was \$31,649,292; of which \$14,650,621 represented automobile tires; \$5,762,079 other tires, and \$4,525,243, belting, hose and packing. These export figures comprise only the rubber manufactures sold in regular trade, and do not include the vast volume of rubber articles sent abroad as a part of the army and navy equipment of the Expeditionary forces of the United States in the war.

RUBBER TIRES. The earliest mention of rubber tires in literature is contained in a work by Thomas Hancock published in 1856, in which he suggests the use of rubber tires on vehicles for the purpose of avoiding vibration. Prior to this, however, a patent for an elastic tire had been granted to Robert William Thompson in 1845, and it has been frequently suggested that this patent anticipated the pneumatic Dunlop tire. As a matter of fact, it appears to have been satisfactorily proved that Dunlop's invention was developed quite independently of any knowledge of Thompson's work. Thompson's tire consisted of an elastic belt made of a number of folds of canvas saturated and covered on both sides with rubber or gutta-percha in a state of solution. The inner tube so obtained was to be protected by

a cover built up around the tire, made by riveting together circular segments of leather and bolting these to the tire. There was also provision by means of a pipe passing "through the tire" for inflating with air. As far as can be ascertained, very little practical use was made of Thompson's invention. In 1856 a solid tire composed of cloth or other fibrous material and rubber sheet in alternate layers was made by W. Coles Fuller. This tire was made up on a cylinder fastened to the wheels by means of flanges. The introduction of the bicycle about 1869 gave the necessary impetus for the further development of the solid tire and subsequently of the pneumatic type. In 1888 the pneumatic tire as we know it was invented by Dunlop and at once came into universal use on the bicycle. In England and on the Continent, an outer casing containing an inner inflated tube was attached to the wheel-rim, while in America a single tube cemented to the rim was more generally used and to this day holds its place on the bicycle. With the advent of the automobile a new field opened for the pneumatic rubber tire. The simplest form of automobile tire is a solid band of rubber, next come the several forms of cushion tires in which the band of rubber is perforated with a number of small holes or provided with a series of openings with the object of obtaining greater resiliency and of making the tire more yielding than the solid rubber type. Solid tires are to-day practically confined to commercial and industrial vehicles, such as delivery trucks, wagons, etc. The great weight and speed of passenger automobiles and their delicate construction require additional protection from vibration to that furnished by springs alone. The pneumatic tire is now in general use on such vehicles, for with these tires the car is suspended in air, which is the most elastic of substances. The most common form of tire is composed of a hollow rubber tube of circular section filled with air and protected from wear by means of an outer shoe or casing. The inner member or tube is made of a very pure rubber, about one-eighth inch thick for cars of average weight. While this tube is very elastic and is air-tight, it would not be strong enough or have adequate resistance to be run directly in contact with the road surface, therefore, it is necessary to protect it by a shoe composed of layers of fabric and rubber composition. The shoe member is provided with beads on its inner periphery designed to interlock with the rim channel. A steel rim is placed around the felloes of the wheel and shaped to fit the shoe or casing, its exact shape depending on the design of the tire. The part of the shoe which comes in contact with the road surface is called the tread. The main part of the shoe or casing is made up of five or more layers of a Sea Island cotton fabric "frictioned" with high-grade rubber composition. This is forced into the mesh of the cloth by machinery so the fabric will be practically waterproof and will join intimately with the other plies by a process of vulcanization when the shoe is cured. Outside of the fabric body a layer of very resilient rubber, approximately of crescent form, known as the padding, is provided to give elasticity to the shoe. Between this member and the tread a number of pieces of heavy fabric called "breaker strips" are

interposed to offer a certain degree of resistance to any sharp object that might penetrate the tread and go through the padding and into the fabric body. The tread is the tire part subjected to the greatest stress, as it must resist the abrading influence of the road, and, in the case of the rear tires, the wearing effect of the friction of the tractive effort. The tread, accordingly, is of very tough rubber composition and does not possess a very great degree of elasticity, which is here sacrificed for strength and resistance to wear. Air is pumped into the tire through a form of automatic valve, firmly attached to the inner tube and projecting through the steel rim and felloe. The valve is held in its seat by a tension spring, and opens only when the pressure of the incoming air is greater than the pressure within the tube. Tires are sometimes classified according as they have a smooth tread or a non-skid tread. The non-skid type has a roughened surface, either small cups, knobs, steel rivets, etc., designed to prevent skidding on slippery highways. Chains are also used for the same purpose, being so made that they are quickly attached or detached, as the necessity arises. Their form is too well known to require description. The casing or shoe of automobile tires differs also in the manner of their seating or attachment to the rim. The clincher type is perhaps the most popular and simplest in that the shoe is held against the rim when the tube is inflated. Another form is known as the demountable. All these varieties have in view to facilitate a more ready removal from the wheel or to make for a more secure attachment. The quick detachable rim is the more modern type. It is permanently fastened to the felloe of the wheel, but the outer clinch of the rim is removable, permitting the casing to be easily pulled off. American tire manufacturers have adopted the following proportions between axle loads and tire sizes:

24-inch tires, all diameters	225 pounds per wheel
30-inch tires, all diameters	350
34 x 28	400
34 x 30	450
34 x 32	555
34 x 34	600
34 x 36	600
4 x 32	650
4 x 34	700
4 x 36	750
4 1/2 x 34	800
4 1/2 x 36	900

The air pressures for inflating pneumatic tires recommended by the same authorities are as follows:

Diameter of tire, inches	Maximum weight on wheel, lbs.	Air pressure in tire, lbs. pr. sq. in.
24	225	50
30	350	60
34	600	70
4	750	80
4 1/2	1,000	90
5	1,000	90

Modern tire equipment includes a gauge which indicates the amount of pressure in the tire and thus over-inflation or the equally dangerous under-inflation are avoided. Consult Goodrich Rubber Company's 'Wonder Book of Rubber' (Akron, Ohio, 1917) and Dykes 'Automobile Encyclopedia' (Saint Louis, annually).

RUBBER-TREES, the sources of caoutchouc (q.v.) or India-rubber (q.v.) are botan-

ically various and widely distributed in the warmer parts of the world. They belong to the four allied groups *Moraceae*, *Euphorbiaceae*, *Artocarpaceae*, and *Apocynaceae*, but not all the members of these families yield caoutchouc, while a similar juice may be obtained from certain outside plants. This substance (latex) is one of those, like the 'milk' of the milkweeds and many others, which are elaborated in the green surface cells and conducted through the plant, for its nourishment by the lactiferous canals. In the rubber plants they run just beneath the bark and often carry the sticky juice in excess, so that "in the gigantic trunks of tropical fig-trees," as Kerner says, "the latex often wells up in large quantities from rifts in the bark which have arisen spontaneously and thickens into long strings and ropes of India-rubber hanging down like a mantle." A rough test of whether a tree-juice has the true properties of caoutchouc is to rub some of it between the fingers until it exhibits the recognized elastic threads; inferior juices of other trees are sometimes mingled with it by native gatherers as adulterants and these may in some cases nearly ruin the whole package, by developing other qualities in coagulation, as for instance those of gutta-percha (q.v.).

The caoutchouc-yielding trees occur in all tropical regions, but are different botanically in each region. The principal commercial supply and the best is obtained from the valley of the Amazon and is known to the trade as Pará rubber; but all other parts of northern South America ship it in large quantities. That which comes from the valleys of the Amazon and Orinoco (Brazil, Guiana and Venezuela) is chiefly the product of the euphorbiaceous genus *Hevea* and especially of *H. brasiliensis*, a tree often 60 feet in height, branching from the base, which, with two or three similar species, grows abundantly in the hot steaming lowlands along the river courses; the juice is obtained by tapping the trees by means of incisions in the bark in the evening and collecting the deposition next morning. Each tree will yield about six ounces in three days and then must be allowed to rest. The main resources in Guiana are the species *H. guayensis* and *paucifolia*, the former of which is called by the natives 'caoutchouc.' That exported from Maranhão is similar. The Ceará rubber is derived from a smaller euphorbiaceous tree (*Manihot glaziovii*), which grows over a large area in that part of Brazil and is tapped when about two years old. The Pernambuco or Mangabeira rubber is the product of a small, drooping tree (*Hancornia speciosa*) of the family *Apocynaceae*, which grows on the hills and yields the edible fruit 'mangaba,' for the sake of which it is frequently cultivated in orchards. This is a comparatively poor sort of rubber. Nearly all the crude rubber above mentioned is exported to Europe. The United States derives its supply mainly from Colombia, Ecuador, Central America and Mexico. This is mainly the product of a tree (*Castilloa elastica*) of the family *Artocarpaceae* related to the breadfruit. It is a lofty tree, with a trunk sometimes three feet or more in diameter and large, hairy, oblong leaves, which grows in the rich soil of wet, low-lying, heavily forested valleys. With some allied species it flourishes from Mexico and Cuba to the mountains of

Venezuela and the Andes, which separate it from the heveas of Brazil. It reaches its largest size and best condition in Panama and Nicaragua. Honduras rubber is good, but some of that from Guatemala is inferior.

The Asiatic supply comes from various ports in Assam (via Calcutta), and eastward to Borneo and is chiefly produced by the rubber-fig (*Ficus elastica*). A large variety of other plants and trees in the Malayan and Papuan region yield rubber, some of which is excellent and of growing importance commercially, and everywhere the early rough and wasteful methods of obtaining the product are being corrected. It is also obtained in northern Australia, in Fiji and in various neighboring islands. More than 100 different trees are known to give rubber-making juices in commercial quantities, while in a great many others, as lettuce, poppy, milkweed and others, it is present in small quantities. The juice of the Brazilian *Hevea* trees is said to yield about 30 per cent of pure rubber; but a product of less than 15 per cent is not regarded as commercially profitable.

Africa is now the principal source of the wild rubber supply of the world next to Central and South America. The bulk of that from the west coast and equatorial region is obtained from various climbing shrubs belonging to or allied to the apocynaceous genus *Vahea*, few of which are well known to botanists. In Liberia and somewhat elsewhere are rubber-bearing figs; and a large part of the extensive product of Madagascar and the Mozambique coast is derived from a *Walbergia*, species of which also give much of the caoutchouc received from the Malayan Islands.

Cultivation of Rubber Trees.—Attempts have been made in most countries, where suitable conditions prevail, to propagate the rubber trees in plantations of prescribed dimensions, and capable of rational supervision by experts, rendering the planter independent of native delinquencies and assuring annual crops of first quality for an indefinite number of years. It has been demonstrated that the rubber tree can produce, under proper management, a regular and increasing crop, for each year of its natural life, without being injured. Many thousands of acres of rubber are rapidly being developed in Mexican plantations in the tropical coast lands from the country round the Isthmus of Tehuantepec southward into Guatemala. Progress has been retarded on account of lack of previous knowledge or precedent in the business, yet the difficulties seem to have been surmounted, and it is now demonstrated that the rubber tree can be artificially cultivated when conditions under which its growth is stimulated are understood. In Chiapas, the numerous river bottoms afford the character of soil required, favorable atmospheric conditions and abundance of rain-fall. The rubber lands of this region are covered with thick tropical forest growth, which it is necessary to clear. The rubber tree shoots, raised from seed in neighboring nurseries and about a foot high, are planted in the clearings generally to the number of 200 trees to the acre. At six years of age the tree is tapped, yielding a small first crop. Hundreds of thousands of every age are growing in strength and luxuriance, with a

prospect of affording an ever-increasing supply of the crude product annually. The Central American rubber tree will not flourish in swamps, though moisture is a prime requisite. Hence the saying: "A rubber tree must have its feet dry and its head damp." Extensive experiments have been made with various kinds of rubber plants; but the *Castilleja* has been found to be the best adapted to soil and other conditions obtaining in Mexico and Guatemala. Rubber can be grown in commercial quantities in practically all the states of southern Mexico, where it is sometimes cultivated near the extreme limit of 3,000 feet above sea-level. However the best rubber trees grow there at from 300 to 1,000 feet altitude. The altitude it affects varies in different lands, preferably but little above sea-level, but in some localities 1,000, 1,500, or even 3,000 feet above tide water. The rubber plant so commonly grown as an ornamental house plant is the East Indian fig (*Ficus elastica*).

In the extensive plantations of Ceylon, where the growing of rubber for several years has been a commercial success, efforts have been directed to the cultivation of the Pará variety, which has proven almost as successful there as in its native place. In the Malaya Peninsula excellent cultivated rubber is now being marketed yearly in continually growing quantities. But notwithstanding these successful efforts at the cultivation of rubber trees, fully half the rubber used comes from the forests of South and Central America and guayule plains of Mexico in 1914, and the market was still ruled by the price of the best Brazilian rubber. Cultivated rubber has rapidly come to have a very important part in supplying the market. In 1890 there were practically no rubber plantations in existence. In 1900 the rubber plantations were just beginning to produce enough rubber for experimental purposes; and three years later Ceylon exported 41,684 pounds, which had grown to almost 25,000 tons in 1916. British Malaya has also become a great rubber-producing country with over 800,000 acres planted to rubber trees. The report of the importations into the United States show the wonderful growth of cultivated rubber. The imports had increased from about 30,000 tons in 1904 to over 86,000 tons in 1915. Of the latter more than 50 per cent came from rubber plantations in the Orient and Mexico. Owing to the fact that scientific methods are now being used in the tapping of plantation trees and the care of the rubber obtained therefrom, cultivated rubber now brings, in the open market, from 25 to 50 per cent higher prices than the best Pará wild rubber. In 1916 the total world crop of rubber was about 200,000 tons or over 50,000 more than that of the preceding year; and this increase was due to the constantly increasing output of the rubber plantations. From 1914 to 1916 the rubber supply from Ceylon and India increased from 15,000 to 25,000 tons; that of the Malaya Peninsula and adjoining lands from about 50,000 to over 105,000; while that of South America remained stationary. During the same period the output of the Kongo, French Kongo and Sudan rose from 3,900 to over 5,000 tons; while that of the rest of Africa decreased from 4,600 to about 2,000 tons. The import figures

show that over 65 per cent of all the rubber marketed in 1916 came from cultivated rubber plantations. This is very suggestive. But the facts are even more in favor of the cultivated rubber which reaches the market almost pure while the wild variety contains from 20 to 25 per cent impurities, which considerably increases the percentage of cultivated rubber marketed. At the beginning of 1917 the following was the number of acres planted to rubber trees in the Orient: Ceylon, 230,000; Malaya (Malacca, etc.), 600,000; Borneo, 30,000; Dutch East Indies, Java, Sumatra, etc., 500,000; India and Burma, 40,000; German colonies, Samoa and West Africa, 12,000. In addition to these there are probably 50,000 acres planted in Mexico and Central America, if not more. Owing to the revolutionary condition of the country and the difficulty of obtaining labor the rubber plantations of Mexico produced little rubber for export simply because the rubber was not taken from the trees. But there are in southern Mexico some plantations containing from 5,000 to 20,000 acres, on some of which are trees from 10 to 20 years of age. Consult Akers, C. E., 'The Rubber Industry in Brazil and the Orient' (London 1914); Brown, H., 'Rubber, its Sources, Cultivation and Preparation' (London 1914); Locke, R. H., 'Rubber and Rubber Planting' (New York 1914).

RUBBLE WORK. See MASONRY.

RUBEFACIENTS, substances or agents which, when applied for some time to the skin, occasion a redness and increase of heat. When the irritant effect of any agent amounts to blistering, or causes discharge of pus or matter, the action is said to be vesicant or suppurative. All these agencies are included under the one term counter-irritants, the rubefacient action being the mildest of the three, and dependent generally upon the form and duration of the application; as, for instance, mustard or ammonia may be used so as to produce only the most transient redness, or may be made to cause blistering or suppuration. Among the most commonly used rubefacients are hot water, ammonia, mustard, oil of turpentine, powdered ginger, spirit of wine, camphor and chloroform vapor.

RUBELLITE, the red or deep pink variety of tourmaline (q.v.); when transparent, valued as a gem.

RUBENS, roo'bēnz, Peter Paul, Flemish painter: b. Siegen, Westphalia, 29 June 1577; d. Antwerp, 30 May 1640. He was (or, according to some, at Cologne) of good citizen family who had gone from Antwerp to Cologne on account of religious oppression, and who, while there, had become the steward of Anne, wife of William of Orange-Nassau, the famous liberator of the United Provinces. He was compelled to remove to Siegen, a small town, because of offenses committed, and it was not until his death in 1588 that the widow was able to return to Antwerp. There the boy studied in the Jesuit College and was page to a lady of rank. He studied art first with Tobias van der Haegt, and afterward with Adam van Noort, but his chief master was Otto van Veen (called Otto Vaenius). With this artist, who was court painter to the Regent of the Netherlands under Spain, the Infanta Isabella Clara Eugenia,

Rubens remained from 1596 to 1600; and at the end of that period of time went to Italy. It is evident that he had the best introductions; and yet the young man's courteous manners and liberal training, as well as his great ability as a painter of portraits, must have made him welcome at once.

At Venice he met the famous and magnificent Duke of Mantua, Vincenzo Gonzaga, who at once employed him, sending him first to Rome, placing him near his own person at his own palace in Mantua, and sending him to Spain in 1603. While in Mantua he painted the famous triple altar-piece for the Prince's chapel: a work of which the greater part of the middle composition is in the church of Saint Trinita in Mantua, one wing at Nancy in the Provincial Museum, and one at Antwerp. It was not until 1608 that he returned to the North, finding his mother dead on his arrival; and settled in Antwerp, his home from that time. It was then that he painted the first of the two wonderful pictures which are in the cathedral of Antwerp, the 'Raising of the Cross'; and two years later, for the company of the Arquebusers, its companion, the famous 'Descent from the Cross,' which is in itself a perfect embodiment of Rubens' art. He married, and now having property, both from his own inheritance and labor, and in right of his wife, bought land and built himself a house, of which drawings remain and in which he lived for 30 years in the fashion of a very wealthy burgher; though having, through the practice of his art, unusually close relations with the Infanta's court and the nobility, both Spanish and Flemish. It was in this capacity that he went to Spain on a mission for his patroness, the regent of the Netherlands, and her husband, the Archduke Albert of Austria, and was sent from Spain to England by the famous Minister, Olivares. It is not to be forgotten that he was looked upon as a subject of the Spanish monarchy, and that in his capacity as a good Catholic he would have felt no objection to this view of the case, though he never took sides strongly against the Protestant rising of many of his countrymen. In England he was knighted by King Charles I. Finally in 1630, being then in his 54th year, he returned to Antwerp and married a second time. From this time onward his art employed him almost incessantly, in spite of a short intervention due to religious divisions between the northern and southern provinces; and his fame and popularity increased until his death in 1640 in Antwerp. His 'Portrait of Marquis Ambrose de Spinola' is owned by Henry C. Frick of New York.

Few artists have had so varied a career, with so many other subjects of high interest to interfere with the peaceful pursuit of their art; and yet few artists have approached Rubens in the amount of artistic work done. This is to be accounted for in part by his extraordinary skill and success in assimilating the work of his many assistants (their names are those of men afterward famous in their art, chief among them Jordaens and Van Dyck); but partly also by the almost unexampled facility of work which he gained and which remains unique in the records of the art of painting. In his earlier days he copied great numbers of paintings by Italian masters, as was the cus-

tom then, and there can be no doubt that his facility and range were greatly increased by this practice. His work done after the age of 30 is uniformly wonderful for his power over all his materials, and all the different processes which enter into painting on a large scale. The fresh and rosy scheme of color which he adopted must have been natural to his instincts; original with him and not derived: moreover, his strong and intelligent drawing, though gained by practice in many schools, was still his own creation. His tendency to excess of action and to the appearance of violence, as in the famous 'Fall of the Rebel Angels,' in Munich, and many similar works, does not seem to imply a headlong or self-forgetful mood; he seems to have been always master of himself, and his paintings were always popular (that is, in sympathy with his times), in style and management. He became in this way the typical artist of his epoch and the most admired master, the man chosen for great state undertakings in art as well as in diplomacy. It was in this capacity that he was employed by the Queen Dowager of France, widow of Henry IV, to decorate her palace of the Luxembourg in Paris, and the great paintings which are now in the new Hall of Rubens in the Louvre were prepared for that purpose. Studies for them are at Munich.

All the treatises on Flemish painting deal with Rubens, and the dictionaries of artists give him much space. The most important books devoted to him are those by Max Rooses 'Life of Peter Paul Rubens' (Antwerp 1903; Eng. trans., 2 vols., Philadelphia 1904), and by Emile Michel, translated into English as 'Rubens, his Life, his Work, and his Time' (2 vols., New York 1899). This book is very richly illustrated. The collections of artists' biographies do not always contain Rubens' biography; but an excellent life of him by Charles W. Kett is included in the series called 'Illustrated Biographies of Great Artists' (1878-79). There are many books published in Belgium, either in French or in Flemish, which deal with the different stages in his remarkable career, and some of these are readily accessible. The essay on Rubens in 'Great Masters' by John La Farge (New York 1904) is of great critical value. The *Gazette des Beaux-Arts* has several important papers with elaborate illustrations. Consult also his correspondence published as 'Codex Diplomaticus Rubenianus' (Antwerp 1887-1909); Calvert, G. H., 'Life of Rubens' (Boston 1876); Gachard, L. P., 'Histoire de P. P. Rubens' (Paris 1877); Hortic, L., 'Rubens: the Story of His Life and Work' (New York 1916); Knackfuss, H., 'Rubens' (New York 1904); Rose, G. B., 'Renaissance Masters' (3d ed., ib. 1908); Stevenson, R. A. M., 'Peter Paul Rubens' (New York 1909); Dillon, E., 'Rubens' (1910).

RUBIACEÆ, a well-marked family of plants, almost exclusively found within the tropics. The leaves are simple, entire, opposite, with interpetiolar stipules. The flowers are usually arranged in panicles or corymbs. The calyx is adherent, with a definite number of divisions or none. The corolla is superior usually tubular and regular, with a definite number of divisions. The stamens arise from the corolla, all on the same line, and alternate

with its segments. The ovary is inferior, surmounted by a disc, usually two-celled, occasionally with several cells; the style is single, sometimes partly divided; the stigma usually simple, sometimes divided into a number of parts. The fruit is inferior, dividing into halves, or not dividing, and dry or succulent; sometimes it is many-celled. Many of the species of this family are of considerable importance, being largely used in medicine, acting as tonics, febrifuges, emetics and purgatives. The species of *Cinchona* yield Peruvian bark. An extract, with some sweetness and a more astringent taste than terra japonica, and called by the Malays gambier, is obtained from *Uncaria gambir*. Ipecacuanha is the root of *Cephaelis ipecacuanha*, a little, creeping-rooted, semi-herbaceous plant, found in the damp forests of tropical America. Coffee is the seeds of a plant of this family, *Coffea arabica*. A few species bear an edible fruit, such as the genipap of South America, the nahil peach of Sierra Leone and the voa-vanga, a good dessert fruit in Madagascar. Among dyeing plants there is *Oldenlandia umbellata*, whose roots are the chay-root (q.v.) of commerce.

RUBICON, roo'bi-kon, the ancient name of a river in Italy of some celebrity in Roman history. Cæsar by crossing this stream, at that time regarded as the northern boundary of Italy, finally committed himself to the Civil War. Hence the phrase, "to pass the Rubicon," means to take the decisive step by which one commits himself to a hazardous enterprise. It is very doubtful under what name the Rubicon now exists, the honor being claimed by two streams—the Fiumicino and the Luso.

RUBIDIUM, a rare metal discovered by Bunsen and Kirchhoff in 1860, by means of spectral analysis, in the residue obtained by evaporating a large quantity of the mineral water of Dürkheim, Germany. The metal and its salts exhibit two dark red lines in the blue part of the spectrum—hence the name, from the Latin *rubidus*, "dark red." Rubidium has the atomic weight 85.4, and the symbol Rb. It is a white, shining metal, having a specific gravity of 1.52; at ordinary temperatures—even so low, indeed, as -10° C.—it is soft as wax; it is easily oxidized; when thrown on water it decomposes that liquid with evolution of hydrogen, which takes fire because of the heat produced in the reaction. Rubidium forms one of the metals of the alkalis, being analogous in its properties with potassium and sodium; its compounds also closely resemble those of these metals; thus it forms a characteristic hydrate (RbHO), which is a white, solid substance, feeling unctuous to the touch, deliquescent in the air, and dissolving in water to form a strongly alkaline liquid. Rubidium forms one chloride (RbCl), bromide (RbBr), and iodide (RbI), and in all its compounds comports itself in a manner precisely analogous with potassium and sodium.

RUBINOW, Isaac Max, American economist and statistician: b. Grodno, Russia, 19 April 1871. He came to the United States in 1893, was graduated at Columbia University in 1895, and took his M.D. at New York University in 1898. He engaged in the practice of medicine in 1898-1903, afterward adopting economics as a profession. In 1904-11 he was

PETER PAUL RUBENS

economical and statistical expert in the United States Department of Agriculture and the Department of Commerce, and later became statistical expert for an insurance company until 1915 when he became director of the social statistics department of the board of public charities of New York. He is well known as a writer on Russian economics, social insurance and Socialism. Author of 'Russia's Wheat Surplus' (1906); 'Economic Condition of the Jews in Russia' (1908); 'Russia, Spain' (1911); 'Social Insurance' (1913); 'Was Marx Wrong?' (1914); 'Standard Accident Table' (1915); 'Standards of Health Insurance' (1916), etc.

RUBINSTEIN, roo'bin-stīn, Anton Gregor, Russian composer and pianist: b. Wechwotynec, 28 Nov. 1829; d. 20 Nov. 1894. His parents were Jewish and soon after his birth removed to Moscow. His mother, being a good musician, was his first teacher; he next studied with Villoing, a Frenchman, and at nine played in a concert at Moscow. He accompanied his teacher to Paris, where in 1840 he played before the most distinguished musicians. He was advised by Liszt to study in Germany and after a concert tour in England, Holland and elsewhere, he settled in Berlin to study theory under Dehn. He returned to Russia in 1848, settling in Saint Petersburg. In 1855 he was enabled to visit Germany again for study; here also he succeeded in finding publishers for his compositions, and made concert tours that extended to London and Paris. In 1858 he was again in Saint Petersburg, where he was appointed court pianist; in 1859 he became director of the Russian Music Society and in 1862 founded the Saint Petersburg Conservatory, and was director until 1867. He made concert tours in Europe in the following years and appeared in America in 1872-73. As a piano player he occupied the front rank; in perfection of technique he had few peers and was excelled by none. As a composer he was prolific, brilliant; but showed a lack of self-discipline which prevented his compositions from attaining the highest merit. He wrote songs; his best-known works are the Ocean operas, pianoforte pieces, orchestral scores and Symphony and the pianoforte concertos in G major and D minor and the trio in B-flat. His operas, such as 'The Maccabees' (1875); 'Paradise Lost' (1875); 'Sulamith' (1883), had but a partial success.

RUBLE, roo'bl, or **ROUBLE**, a silver coin, the standard of money in Russia, containing 278 grains of fine silver, and equal to about 76 cents in American money. In actual circulation there is little but paper money, valued at from 10 to 20 per cent below its nominal value. A ruble is divided into 100 kopecks. Half and quarter rubles, and 5th, 10th and 20th parts of a ruble, are coined in silver; gold coins of the nominal value of three rubles (the Imperial ducat) and five rubles (the demi-Imperial) are also coined.

RUBNER, rūp'nér, Cornelius, Danish musician and educator: b. Copenhagen, 26 Oct. 1855. He studied under Gade Hartmann at Copenhagen, Reinecke and David at Leipzig, and afterward under Hans von Bülow and Rubinstein. He was for many years a professor of music, court pianist and conductor

of operas and concerts in Germany. Since September 1904 he has been head of the music department at Columbia University, New York. Author of 'Prinz Adzor'; a symphonic poem 'Friede, Kampf und Sieg' and many piano pieces, songs, etc.

RUBRIC (Lat. *ruber*, red), was the name applied to those portions of old manuscripts and books which, for typographical embellishment or on account of their importance in the text, were printed in red ink. Often, as in the old monastic manuscripts, only initial letters in the paragraph were so treated. With the development of the copyist's art, however, rubricated manuscripts became ornate; the initial letter of every noun, perhaps, was rubricated, chapter headings, thumb-nail indexes, marginal comments, and in cases whole passages of the text were highly ornamented rubrics.

The use of the red letter text became common in the case of religious treatises, and so certain rules and directions in prayer books, explanations and responses are printed in red ink. This is the case with the Roman missal, where the matins, lauds, beatifications, etc., are always in red, and in the liturgy, where the directions for the performance of the service are also in red. In the old Bibles the chapter heads were so treated. Modern typography discards such profuse use of colored ink and usually substitutes in its place type of a different face from the rest of the text, but the portions thus emphasized are still called rubrics.

Spanish custom has given another significance to the word, and in Spanish denotes the flourish so common after Spanish signatures. This likewise results from the fact that the rubrics were the most conspicuous features of a page.

RUBRUQUIS, rū'brū'kēs, or **DE RUYS-BROEK**, **RUBROUCK**, **RYSEBRUCK**, **FRIAR William** of, mediaeval traveler and author: b. Rubrouck, French Flanders, about 1215; d. about 1270. He was a contemporary and brother Franciscan of Roger Bacon, but little is known of him except what can be culled from his own writings and from Roger Bacon's mention of him in his 'Opus Majus'; he is mentioned also in the records of the Franciscan order, and it is now clear that he was born in France instead of in Brabant as was formerly supposed. In 1253 Louis IX (Saint Louis) sent him with two other friars on a special but informal mission to Tartary to spread Christianity and to treat with the Tartar prince, Sartah, son of Batu; the king having heard that the prince had embraced Christianity. He set out by way of Constantinople, landed on the Crimean coast and proceeded by means of horses and carts to the courts of Sartah and Batu, crossing the river Don and reaching the Volga. He was then sent by Batu to the Great Khan in Mongolia, a journey of great hazard, and returned through Persia and Asia Minor. He reached home in the late summer of 1255, having traveled nearly 11,000 miles. His report of the journey, written for Louis IX, is considered one of the finest travel narratives in existence. While the Latin in which it is written is not scholarly it sets forth in vivid style the geography, ethnography, manners, customs, religion and language of the region traversed, and shows irrefutable evidence of a

keen, accurate, honest and highly intelligent observer whom time has failed to discredit. Five manuscript copies of the narrative are known to be in existence, the most important being the one at Cambridge and two at Leyden. Portions of the narrative were published by Hakluyt, (1598-99), but it was not until 1839 that a full edition of the text was published by the Paris Geographical Society in 'Recueil de Voyages' (Vol. IV). There is no adequate commentary on the subject matter. There are, however, two useful editions published by the Hakluyt Society, 'William of Rubrouck . . . Johan of Pean de Carpene,' translated and edited by W. H. Rockhill (London 1900), and 'Texts and Versions of Carpini and Rubruquis,' edited by C. Raymond Beazley (London 1903). Consult also Schmidt, F. M., 'Über Rubruk's Reise' (Berlin 1885); D'Ohsson, 'Histoire des Mongols' (1852); Bretschneider, 'Medieval Researches from Eastern Asiatic Sources' (1888); Beazley, 'Dawn of Modern Geography' (1906).

RUBUS, a genus of plants of the family *Rosaceæ*, of which more than 1,500 species have been described. They are mostly natives of the northern hemisphere and are especially abundant in Europe. About 100 are indigenous to North America. They are mostly shrubs whose stems (canes) are biennial or annual, prickly, erect, curving, climbing or trailing. They have simple or compound alternate leaves, white or pink flowers usually in corymbs or racemes, followed generally by compound fruits consisting of many drupelets. In the blackberry the drupelets are united to the receptacle; in the raspberry they are not. Besides the raspberry, blackberry and dewberry (q.v.), many species are useful for food or ornament. Among the best known are the European bramble (*R. fruticosus*), wineberry (*R. phoenicolasius*), flowering raspberry (*R. odoratus*), and the cloudberry, yellowberry, bake-apple berry (*R. chamamorus*). The Rocky Mountain flowering raspberry (*R. deliciosus*), the briar rose, bridal rose or strawberry-raspberry (*R. roseaefolius*), and *R. crataegifolius* are well-known ornamental species in shrubberies, etc. See BLACKBERRY; RASPBERRY, etc.

RUBY, the rich red, transparent variety of corundum, having a hardness of nine and a specific gravity of four. The name is sometimes used for other red gems (see RUBY SPINEL), and improperly for richly colored garnets, of the variety pyrope. The stones called Cape rubies and Arizona rubies are only fine pyropes, coming respectively from the South African diamond mines and from Arizona and New Mexico. (See PYROPE). Siberian ruby is a term sometimes applied to gems of rubellite or red tourmaline (q.v.), and Brazilian ruby to the deeper shades of pink topaz, altered to that color by heat. The true rubies recently mined in the Cowee Valley, in North Carolina, have attracted much interest, being in some cases as fine as those from Burma; but they are mostly small, and it is not certain whether they will prove of real importance. They occur in a greatly decomposed igneous rock, in the same manner as the very similar crystals of sapphire from Yogo Gulch, Montana. The rubies of Burma, formerly spoken of as Pegu, are derived from a crystalline limestone. In

these cases, and indeed generally, the gems are largely found in gravels and surface deposits formed from the decomposition of the parent rocks. True rubies of large size are very scarce, so that one of three carats weight, flawless and of good color, is worth much more than a diamond of the same size. Like all the deeply-colored corundum gems, rubies are strongly dichroic, their color varying with the direction in which light traverses the crystal, whether transverse or parallel to the axis of the prism. The presence of microscopic cavities or of included crystals of extreme minuteness, disposed in a certain parallelism to the crystalline axes, produces the optical effect known as asterism, which is exhibited by the highly prized gems called star rubies (and star sapphires). In less amount or when irregularly distributed, the same causes produce defects known as "silk," and cloudiness. Many efforts have been made to produce the ruby by chemical means, and a dozen or more processes have been devised with greater or less success within the past 50 years, but with little practical result. Crystals have been obtained, of fine color, but mostly small, or in flat hexagonal plates too thin to furnish gems. Some years ago larger pieces appeared in the market that caused some concern from their close resemblance to natural rubies. The process was not made known, but was judged to be that discovered by Frémy and Feil, by fusing an aluminate of lead with silica. They were detectable by the microscope, which showed that they contained minute cavities that were rounded and bubble-like, while those in real rubies are angular and crystalline. The French "Syndicate of Diamonds and Precious Stones" decided that all such rubies must be sold as "artificial," under penalty of fraud.

RUBY MATRIX, is a name recently given to a beautiful combination of red or pink corundum with a bright green variety of hornblende (amphibolite) found at the Cullakenee corundum mine in Clay County, North Carolina; it has been proposed to use it as an ornamental stone, though the ruby-corundum is not transparent enough to cut gems.

RUBY SPINEL, this mineral is an aluminate of magnesia. It crystallizes in octahedrons, with a hardness of 8 and a specific gravity of 3.5 to 3.7, usually of some shade of red, sometimes very rich, and transparent to translucent. Fine specimens make beautiful gems, known as spinel rubies, not readily distinguishable from true (corundum) rubies, though less hard, less dense and less valuable. The historic "Black Prince" ruby, in the crown jewels of England, is believed to be a spinel. True rubies may also be distinguished from spinels by the dichroism which belongs to all the deeply colored corundum gems. Red spinel has several other varieties, with special names; it is called Balas ruby when the color is rich pink, rubicelle when it inclines toward an orange red, almandine ruby when it tends toward a purplish. Spinel is a frequent associate of the true ruby in Burma, Siam, Ceylon, etc. It usually occurs in crystalline limestones, though it is occasionally found in other metamorphic, and even in volcanic rocks.

RUBY-THROAT. See HUMMING-BIRD.

RÜCKER, rük'ér, Sir Arthur William, English scientist and educator: b. 23 Oct. 1848; d. 1 Nov. 1915. He was educated at Brasenose College, Oxford, and was a Fellow there in 1871-76. He was professor of physics at the Royal College of Science, London, in 1886-1901; and was principal of the University of London in 1901-08. He was secretary of the Royal Society in 1896-1901; received the Royal Society's Royal Medal in 1902, and was knighted in that year. He was connected with various important official commissions for the advancement of university education. He was joint author of 'On the Expansion of Sea Water by Heat' (1876); 'Properties of Liquid Films' (1880-92); 'Magnetic Surveys of the British Isles for the Epochs 1886, 1891' (2 vols., 1890-96).

RUCKERT, Friedrich, fréd'rîn rük'ért, German poet and Orientalist: b. Schweinfurt, Bavaria, 16 May 1788; d. Neuses, near Coburg, 31 Jan. 1866. He was educated at Heidelberg and at Würzburg. He first began to write under the pseudonym of "Freimund Raimar," and 'Deutsche Gedichte' appeared with that signature. From 1826 to 1841 he occupied the chair of Oriental languages in the University of Erlangen, and while there was called to Berlin as privy councillor to Frederick IV. Here he also pursued his work as a philologist and poet. He retired to private life in 1848, becoming one of the most prolific writers of his day. He had a remarkable command of language and wrote almost every known form of verse. His original poems relating to the East are 'Morgenländische Sagen und Geschichten' (1837); 'Rostem und Suhrab: eine Heldengeschichte' (1838); and 'Die Weisheit des Brahmanen' (1836-39). His adaptations include 'Die Verwandlungen des Abu Seid' of Hariri (1826); 'Nal und Damajanti' from the 'Mahabahrata' (1828); 'Amrîlkais' (1843); and 'Hamasa' (1846). Among his other works are 'Saul und David' (1843); 'Liebesfrühling' (1844); and 'Lieder und Sprüche' (1866). Consult biographies by Beyer (1868-77); Konrad Fischer (1889); and Reuter, F., 'Rückert in Erlangen und Joseph Kopp' (1891).

RUCKSTUHL, rük'stool, Fred Wellington, American sculptor: b. Breitenbach, Alsace, 22 May 1853. At two he was brought to America by his parents who settled in Saint Louis, Mo. His art studies were begun in 1883 in Paris. His first exhibit, a life size nude figure called 'Evening,' won honorable mention in the Salon and a Grand medal at Chicago World's Fair, and has since been in the Metropolitan Museum, New York; bronze group, 'Mercury Amusing Himself,' Portland place, Saint Louis; bronze statue, 'Solon,' in the Congressional Library, Washington, D. C., and for the façade of the same library, heads of Franklin, Goethe and Macaulay; bronze, 'Victory,' on the Soldiers and Sailors' Monument, Jamaica, L. I.; equestrian statue of: 'Gen. John F. Hartranft,' Harrisburg, Pa.; 'Wisdom' and 'Force,' colossal marble statues at entrance of Appellate Court House, New York; 'Gloria Victis,' a bronze group on Confederate monument, Baltimore; 'Defense of the Flag,' a bronze Confederate monument at Little Rock, Ark.; 'Phoenecia,' marble colossal statue, at the Customs House, New York City;

'Color Bearer,' Petersburg Battlefield, Va.; equestrian statue, 'Gen. Wade Hampton,' Columbia, S. C.; marble statue, 'John C. Calhoun,' in the Hall of Fame, Washington, D. C.; bronze group, 'Woman's Monument,' at Columbia, D. C.; a bronze statue, 'Dr. Charles D. McIver,' Raleigh, N. C.; monument to the 'Three Partisan Generals, Sumter, Moultrie and Pickens,' at Columbia, S. C.; marble statue, 'U. M. Rose,' in the Hall of Fame, Washington, D. C., etc. Mr. Ruckstuhl is member of the National Institute of Arts and Letters, the National Sculpture Society, the Architectural League, etc.

RÛDAGI, roo'da-gē, or **RUDAKI**, Farid-eddin Mohammed, ABDĀLLAH, Persian poet: b. Rûdag, Transoxiana, about 870-900; d. 954. He was the earliest of the great modern Persian poets and for many years lived at the court of Nasr II, ruler of Khorasān and Transoxiana, in affluence and with high honors. He is said to have been blind from birth, but his writings show an accurate knowledge of colors. His work survives only in fragments but these are models of form, and of exquisite taste and feeling. He is known as 'the Father of Persian Literature' and succeeded in emphasizing clearly the different forms of epic, lyric and didactic poetry. He is credited with originating the *diwan*, the arrangement of a poet's work in nearly alphabetical order which still maintains among Mohammedan writers. Of his epics only stray lines remain, although there are 52 of his *kasidas*, *ghazals* and *rubā'is*. His translation of an Arabic version of the old Indian fables 'Kalilah and Dinmah' into Persian also is lost. After the death of his royal patron in 942 he fell into poverty and obscurity. A complete edition of his remaining works, in the Persian text and with a German translation, was prepared by Ethé, H., 'Rûdagi der Samaniden-dichter' in 'Göttinger Nachrichten' (pp. 663-742, 1873). Consult Pickering, C. J., 'A Persian Chaucer' (1890); Brown, E. G., 'Literary History of Persia' (1902).

RUDD, Steele (pen name), Australian literary man (see DAVIS, ARTHUR HOEY).

RUDD, William Platt, American lawyer: b. Albany, N. Y., 9 June 1851. He studied law at Union University, was admitted to the bar in 1875 and became a member of the law firm of Harris and Rudd. He was counsel for important corporations and in 1910 was elected justice of the Supreme Court of New York for the term ending 1924.

RUDDER, an instrument by which a ship is steered, being that part of the helm which consists of a piece of timber which enters the water and is attached to the sternpost by hinges, on which it turns. The action of the rudder may be thus explained: while it remains in line with the keel, the force of the water gliding past the deadwood, or narrow portion of the stern, is equal on both sides of the rudder and equilibrium is maintained; if however the rudder be forced to one side the pressure is taken off on the opposite side, while the water exercises an increased pressure on the side to which the rudder is turned. The effect is to force the stern round on the centre of gravity as a pivot, the ship's head, of course, turning to the same side as the rudder. When the head

has sufficiently deviated from its former line the rudder is permitted to resume its straight position. In sailing on a wind, the rudder is kept permanently on one side to counteract the tendency to make leeway.

RUDDER FISH, so named from being perceived usually in the wake of ships, following the rudder, and doubtless attracted by the refuse thrown overboard, is a small fish of the genus *Palinurus* allied to the mackerel family, very common in the Pacific and Atlantic oceans. The *Palinurus perciformis*, the rudder perch, or black pilot fish of the fishermen of Martha's Vineyard, attains a length of from 9 to 12 inches and is caught on the coasts of Massachusetts and New York, specimens having been obtained in Boston Harbor hovering around the sterns of vessels or keeping near such floating bodies as casks, planks, logs and other flotsam. The back and top of the head is brownish with black blotches, the sides bluish-white with minute black dots and the under parts lighter; the color of the young is a bright bronzed black, variegated with yellow circular spots, obscure reddish hues and streaks of white and yellow lining the sides; there is a depression between the eyes which are protected by an overhanging bony ridge and in front of the fleshy rays of the dorsal are eight short spines. The rudder fish belongs to the division of the scomberoids in which the first dorsal is composed of isolated spines connected by a low membrane, but unlike the scomberoids there are one or more spines in front of the anal fin. The name rudder fish is also less specifically applied to any fish habitually following in the wake of vessels.

RUDDER GRANGE, one of the best known and most humorous of the novels of Frank R. Stockton. It appeared in *Scribner's Monthly* in 1874; and was followed by the 'Girl at Rudder Grange' in 1875 and the 'New Rudder Grange,' 'Camping out at Rudder Grange' and 'Pomona Takes the Helm at Rudder Grange' in 1878; and 'Pomona's Bridal Trip' in 1879; in which latter year the story first appeared in book form. Previous to this Stockton had made a reputation as a writer of stories for children, but 'Rudder Grange' was his first book for adult readers. In the Stockton household was "a middle-sized orphan" from an orphan's home, a very peculiar, sentimental, strong-willed girl of 14, in whom Stockton took a very decided and peculiar interest; for she appealed strongly to his sense of humor and upon whom he bestowed the name of Pomona. The result of his study of her was a paper in *Scribner's Monthly*, entitled 'Rudder Grange,' which attracted wide attention and Stockton was induced to continue the idea, the history of the little girl being carried into womanhood. 'Rudder Grange' brought Stockton seriously before the public as a humorous writer of stories other than children's tales. So popular was this series that Stockton was induced to follow it up with 'Rudder Grangers Abroad' and 'Pomona's Travels.' 'Rudder Grange' is a book without a plot; and it gets along well without. It deals with eccentric and humorous doings and sayings, for the most part of Pomona, from the time she enters the Grange until she finally marries and has a home and a family of her

own. The 20 papers of which the book is made up develop her character by taking her through a series of adventures and ridiculous situations in which the humor is ever on the surface. But an outline of the story would be the story itself.

RUDDIMAN, rüd'i-man, Thomas, Scottish scholar: b. Raggel, Banffshire, October 1674; d. Edinburgh, 19 Jan. 1757. He was graduated at Aberdeen in 1694, revised and edited several works by Scottish authors and to the famous poetical translation of Virgil's 'Æneid,' by Bishop Douglas, added a glossary, which brought him fame as a Latin scholar. In 1714 he published his 'Rudiments of the Latin Tongue,' a work which supplanted all previous Latin grammars in use in Scotland and which he lived to see pass through 15 editions. In 1715 he became a publisher and in this capacity edited and brought out many famous books and in 1725 the first volume of his own 'Grammaticæ Latinæ institutiones,' and an abridgment of the three volumes in 1740. Consult Chalmers, 'Life of Ruddiman' (1794); Chambers, 'Eminent Scotsmen.'

RUDDY DUCK, a rather small, quick-diving handsome duck (*Erismatura rubida*), found throughout North and Central America, and breeding in all suitable localities. It is related to several foreign sea-ducks, the Australian musk-duck, etc., but is itself confined to this continent. This duck is about 17 inches long and chiefly tawny brown, the drake becoming glossy chestnut in full breeding plumage; considerably waved and dotted and the lower parts mottled silver-white.

RUDE, François, frân-swâ rüd, French sculptor: b. Dijon, 4 Jan. 1784; d. Paris, 3 Nov. 1855. He was originally a blacksmith, but entered the École des Beaux Arts in 1807 and was under the instruction of Cartellier. From 1815 to 1827 he worked at Brussels decorating the royal palace and subsequently settled at Paris, where his real artistic life began. His chief works, which show a combination of antique simplicity with modern naturalism, are his 'Mercury' (1827), now in the Louvre; his 'Neapolitan Fisher Boy,' also in the Louvre; his 'Louis XIII,' as a boy 1842; 'Sepulchral Monument of Cavaignac,' in the cemetery of Montmartre (1847); a 'Crucifixion' and the 'Maid of Orleans' (1852), both in the Louvre; 'Hebe' and 'Love as the Conqueror of the World,' in the museum of Dijon.

RUDEL, Jaufré, zhô'frâ roo'dêl, a famous troubadour poet: b. Blaye (Gironde) in the 12th century; d. Tripoli. A soldier and a wanderer, he became celebrated for his love affairs, which he idealized in his poems. He was of noble birth and Lord of Blaye; and in his youth he joined the court of William of Agoult, Lord of Sault. He afterward lived at the Court Geoffroi, Count Bretagne, son of Henry II of England, where he was a favorite and honored as one of the greatest of troubadours. While with this prince, he fell in love with a certain Countess of Tripoli, by report of her brought to the court by pilgrims from Antioch. So impressed was he with the story of her charms and graces that he refused to sing of any other lady. In spite of the opposition of the count, he disguised himself as a pil-

grim and set out to visit the Countess of Tripoli. On the way he became very ill and in this condition he arrived at Tripoli. Word was sent to the Countess and she had the poet brought to her palace, where he had scarcely arrived when he died in the presence of her ladyship, who had him buried in the royal tomb of Tripoli; and she had his poems written in a book with letters of gold. These poems of Rudel are among the most tender in the Provençal literature (q.v.). Rudel's tale has been dramatized by Edmond Rostand in the 'Princess Lointaine.'

RUDERAL PLANTS (Lat. *rudus*, rubbish), plants growing in waste places, amid rubbish and by the wayside. There is usually rapid change in such areas, the profusely-seeded and rapid-growing annuals first securing a foothold and covering the waste space; but these are soon crowded out by the hardy perennials, among which grass is largely predominant. Naturalized plants often gain a temporarily strong foothold in such places because of less severe competition and the absence of natural enemy species, but gradually are reduced in numbers to the natural struggle between native plants.

RUDINI, roo-dé'né, Antonio Starabba di, MARQUIS, Italian statesman: b. Palermo, Sicily, 6 April 1839; d. 7 Aug 1908. In 1866 he became mayor of Palermo and in 1867 a member of the Chamber of Deputies. He was appointed Minister of the Interior in the following year. After the fall of the Menabrea Cabinet he held no prominent office until 1891, when, having become the head of the Constitutional party, he succeeded Signor Crispi in the Ministry of Foreign Affairs and was made Premier. In 1892 the premiership passed again to Crispi, but in 1896 Rudini returned to power as a result of Signor Crispi's disastrous Abyssinian policy. He continued in the premiership until 1898, when he resigned his office. His renewal of the Triple Alliance and conclusion of peace with Abyssinia were the most important of his executive acts, while his continued yielding to the pressure of the Radical party and failure to weld the Conservative elements of the Italian Parliament are quoted against his administration.

RUDOLF OF EMS, mediæval German poet or minnesinger: b. Switzerland; d. Italy, about 1251-54. He began to write about 1225. He wrote many legendary, historic and dramatic poems; and also a version of the Old Testament down to the time of Solomon, 'Weltchronik,' which was dedicated to his patron Conrad IV, and which was widely read as it was for long the only available popular presentation of early Biblical events. He was besides author of the poems 'Der Gute Gerhard'; 'Barlaam und Josaphat'; 'Wilhelm von Orleans'; 'Alexander,' etc.

RUDOLF LAKE (known also as BASSO NOROK and GALLOP), a large lake of eastern equatorial Africa, at the south of the Abyssinian highlands and occupying a portion of the great equatorial plain. It is 225 miles north-east of Victoria Nyanza; and is about 185 miles in length and 37 at its greatest width, its area being about 3,500 square miles. It is deep at the southern end, but shallow at the

northern, where it is fed by the Omo or Nianani River. Having no outlet its water is brackish but not harmful for drinking purposes. The surrounding region is sterile, with high cliffs at the south and lava fields or sandy wastes at the northern end. It was discovered by Teleki and Von Höhnelt in 1888. In 1907 an agreement was reached between Great Britain and Abyssinia, whereby the northern end was ceded to Abyssinia, the remainder falling to Great Britain.

RUDOLF I, roo'dölf, emperor of Germany, founder of the Imperial house of Austria: b. 1 May 1218; d. Gernersheim, 15 July 1291. He was the eldest son of Albert IV, Count of Hapsburg and Landgrave of Alsace, was brought up in the court and camp of the Emperor Frederick II and on the death of his father succeeded to lands of very moderate extent, which, in the spirit of the times, he sought to augment by military enterprises. He gained some territory by his marriage in 1245 and more by his frequent military aggressions. In 1273, while encamped before the walls of Basel, he received the unexpected intelligence that he was elected king and Holy Roman emperor, in preference to Alphonso, king of Castile, and Ottokar, king of Bohemia. His confirmation was not attained without some difficulty, however. Pope Gregory X induced the king of Castile to withdraw his pretensions, but the king of Bohemia, at that time one of the powerful princes in Europe, persisted in his opposition, and a war ensued, in which the latter was defeated, compelled to sue for peace and to agree to pay homage. He broke the treaty in 1277, but the following year was defeated a second time and slain. The Diet of Augsburg in 1282 formally conferred Austria, Styria, Carinthia and Carinola on Rudolf's two sons, Albrecht and Rudolf, as a joint inheritance. He restored peace and order to Germany, and wisely put down the private fortresses, which served as a retreat for banditti and ferocious nobles. For these and other eminent services in the same spirit he obtained the title of "a living law," and was regarded as a second founder of the German Empire. He asked the Diet at Frankfort to secure the imperial throne to his son Albrecht, but the electors were jealous of the powerful family and their refusal caused such mortification to the aged emperor that he did not long survive. Consult Kopp, 'König Rudolf und seine Zeit' (1845-49, continued by Busson 1871); Hein, 'Rudolf von Habsburg' (1874); Schulte, 'Geschichte der Habsburger' (1887); Zisterer, 'Gregory X und Rudolf von Habsburg' (1891).

RUDOLF II, Holy Roman emperor: b. Vienna, 18 July 1552; d. Prague, 20 Jan. 1612. He was educated in Spain, and before the death of his father, Maximilian II, was crowned king of Hungary in 1572, king of Bohemia in 1575, the same year being also crowned at Ratisbon as Roman emperor. He succeeded to the Austrian throne, 12 Oct. 1576. His disposition was mild and his tastes inclined toward literature rather than toward government. Early in his reign he began to impose restrictions upon the holding of public offices by Protestants and in some districts civil war resulted. The western parts of the empire were enabled to overcome the designs of the king, and by 1603 the

Protestants formed an offensive and defensive alliance at Heidelberg to maintain their civil and religious liberties. In Austria, Bohemia and Hungary, however, the Protestant religion was for a time practically suppressed. The Turks made constant inroads in the east and in 1596 Mahomet invaded Hungary, captured Erlau and defeated the Austrians under Archduke Maximilian, though he ceased his incursions at this point. In 1608 Rudolf's brother Matthias, who had made a treaty with the Turks and pacified the disaffected Hungarians, compelled Rudolf to acknowledge him king of Hungary and governor of Austria and Moravia. With this confirmation of Matthias' power the states of Austria regained the religious privileges they had enjoyed under Maximilian. In 1611 Rudolf was formally deposed and Matthias succeeded him. Rudolf was the patron of Kepler and Tycho Brahé and the astronomical calculations produced by these two are known as the "Rudolphine Tables." Consult Gendely, 'Rudolph II und seine Zeit' (1863-65).

RUDOLPH, Franz Karl Joseph, Archduke and Crown Prince of Austria, son of Francis Joseph I: b. 21 Aug. 1858; committed suicide, Mayerling, near Vienna, 30 Jan. 1889. He entered the army in 1877 and saw some active service. He was a gifted linguist; traveled considerably and was a writer of ability. He collaborated on 'Die Österreichisch-Ungarische Monarchie in Wort und Bild' (1886), and was author of 'Fünfzehn Tage auf der Donau' (1881); 'Eine Orientreise' (1884).

RUE, a perennial plant (*Ruta graveolens*), wild in the Mediterranean region, but also cultivated. Its stems are about two feet high, bearing alternate decompound bluish green leaves, pellucid-dotted, with an acrid juice and bitter taste; and corymbs of yellowish green, small, four-parted flowers, with crimped petals. Rue has been employed medicinally on account of its antispasmodic and stimulant properties, and was also used in folk medicine as a disinfectant, probably because of its strong and disagreeable odor and taste, which, however, did not prevent its use as salad. Rue also entered largely into magic rites and witch-lore. Early missionaries in England were said to have sprinkled water from brushes made of rue, whence the name referred to by Ophelia: "There's rue for you . . . We may call it, herb of grace o' Sundays," and Perdita speaks of it, with rosemary, as one of the flowers for remembrance.

RUEDA, roo-á'da, Lope de, Spanish actor and dramatist: b. Seville, in the early part of the 16th century; d. before 1567. He was a gold-beater by trade; but became one of the most successful actors of his day. He is credited with being the first to write popular Spanish drama and to have been, therefore, the leader in the movement that was destined shortly after his day to produce Lope de Vega, Calderon and the other great dramatists of the golden age of Spanish drama. He became the head of a strolling company of players who seem to have wandered over a considerable part of Spain and to have acted plays written by Rueda with a view to suiting the public taste. Therefore, Rueda is credited with having made of the theatre and the profane drama a popular institution. He was also credited in his day with being an excellent dramatist and

a good poet; among his admirers being Lope de Vega and Cervantes. It was not until after his death that his works appeared in print. They were collected and published by his friend Juan de Timoneda from time to time between 1567 and 1588. This collection consists of 10 pasos, or dramatic interludes based upon some simple episode; two dialogues (in verse); four comedias and two pastoral colloques, all, with the exception noticed, in prose; and all bearing the earmarks of having been written for presentation upon the stage, evidently by his own company. The comedias are divided into scenes, but not into acts. These are entitled 'Los Engaños'; 'Medora'; 'Eufemia' and 'Armellina,' the last of which is decidedly the best from both the dramatic and the literary points of view, but it employs mythological characters in a weird and startling manner, which nevertheless display the author's originality and boldness. His manner in the comedias, as in all his work, is light and quite natural even when he deals with supernatural characters. His comic parts are also well presented and in fact the comedy is the only really good part of his two pastoral colloques, the better of which is 'Timbria.' The two dialogues 'Prendas de Amor' and 'Diálogo sobre la invención de las calzas,' together with some songs, constitute practically all of Rueda's poetry that has come down to us. In all his dramas and other works Rueda shows an appreciation of the chief factors in the entertainment of the theatre-going public. In fact the audience seems to be ever in his mind. This is undoubtedly why both Cervantes and Lope de Vega credited him with being the father of popular national drama in Spain. His greatest move in the right direction for the creation of a national drama was his selection of his personages, subjects and scenes from the common life around him. This permitted him to be at once natural and familiar without danger of losing the interest or respect of his audience. In other words, he realized the dramatic element in life and its compelling interest as no Spanish dramatist previous to his day had done; and he set the fashion for representing life in a more or less realistic manner for the great national dramatists who followed him and, to a certain extent, imitated him. Among the editions of his works are two of note, in addition to that by Timoneda, that by the Marquis de la Fuensanta del Valle (Madrid 1895-96), and that by Emil Cotarelo y Mori (Madrid 1908). Consult Cotarelo y Mori, E., 'Estudios de historia literaria de España' (Vol. I, Madrid 1901); Fitzmaurice-Kelly, 'A History of Spanish Literature' (New York 1908); Salazar, S., 'Lope de Rueda y su teatro' (Santiago de Cuba 1911), and Ticknor, 'History of Spanish Literature' (New York 1854).

RUEF, roof, Abraham, American political boss: b. San Francisco, Cal. He was graduated at the University of California in 1884 and was admitted to the bar in 1886. He made himself a political power in San Francisco, and was said to control the city administration through Mayor Eugene F. Schmitz, elected in 1901. There were graft scandals implicating Ruef, as an attorney, together with the mayor and board of supervisors in the division of the spoils. Ruef was brought to trial through the efforts

of San Francisco citizens, headed by Rudolph Spreckels. The services of Francis J. Heney, who had acted for the United States in the Oregon land scandals, and William J. Burns of the United States secret service, were secured and Ruef was in 1911 convicted of bribery and sentenced to nine years, imprisonment. He was paroled in 1915 on a pledge to remain out of politics.

RUELLIA (Neo Lat. named for Jean Ruel, a French botanist of the 16th century), a genus of herbs and shrubs of the family *Scrophulariaceae*. The genus is characterized by opposite leaves, and bears flowers of large size in shades of violet, white and red, and occasionally yellow or orange. There are about 200 species, chiefly native to tropical America, while occasional varieties are found in Asia, Africa and Australia; and some eight varieties are found in the United States. About 20 varieties are under cultivation, some of them being especially desirable for greenhouse use. *R. tuberosa* is the "manyroot," also called "spirit-leaf" and "snapdragon"; *R. paniculata* is a trailing variety found in Mexico and Jamaica and has inch-long blue corollas; *R. ciliosa* is a charming hardy species of southern United States; *R. indigotica* furnishes by maceration an indigo-like dye and is native to India, Burma and China.

RUFF, a sandpiper (*Machetes pugnax*) of the northern parts of the Old World, the female of which is called "reeve." It is about 10 inches long and the bill $1\frac{1}{4}$; above it is varied with black, rufous and gray, arranged in oblique bands on the scapulars and tertiaries and whitish below; primaries dark brown, with green reflections above and with inner webs finely mottled toward the base; the tail transversely barred; sides of rump white, bill brown and legs yellow. The males in spring have the feathers of the neck developed into a kind of ruff, whence the common name, and the face is covered with reddish papillæ. They fight during the breeding season, unlike most wading birds; they are also polygamous and larger than the females, in these respects seeming to form one of the links between wading and gallinaceous birds. The colors of the ruff vary exceedingly and no two are precisely similar. They are natives of northern Europe and Asia, migrating southward during winter, and they are found chiefly in flocks, in marshy districts; they feed at night on worms, insects and larvæ; the nest is made of coarse grass and is placed in a hollow of the ground; the eggs are four or five, pointed, green, with brown specks. Their flesh is highly esteemed for the table; they are taken alive in nets and are fattened for market on bread and milk and boiled wheat, in a dark place to prevent their fighting; great numbers are sent from Holland to London.

RUFFED GROUSE. See GROUSE.

RUFFED LEMUR. See LEMURS.

RUFFIN, Edmund, American agriculturist: b. Prince George County, Va., 5 Jan. 1794; d. near Danville, Va., 15 June 1865. He was educated at William and Mary College, served in the Virginia legislature, was for many years president of the Virginia Agricultural Society, and in 1833-42 editor of the *Farmer's Register*.

ter. He was an ardent State's rights man and as member of the Palmetto Guard of South Carolina fired the first shot on Fort Sumter in 1861. He committed suicide because of his unwillingness to give allegiance to the United States government. He published 'Essay on Agricultural Education' (1833); 'Anticipations of the Future to Serve as Lessons for the Present Time' (1860); edited William Byrd's 'Westover Manuscripts' (1841), etc.

RUFFO, roof'fô, Fabrizio, Italian cardinal: b. San Lucido, Calabria, 16 Sept. 1744; d. 13 Dec. 1827. He came of a ducal family and was educated as a priest, but never took orders. He gained the favor of Pius VI, who had him appointed treasurer-general and made him a cardinal in 1791. He headed the royalist movement in Calabria, his family connection greatly aiding him, and in 1799 he became vicar-general. With Fra Diavolo, the brigand chief, he raised an army and succeeded in overturning the Republican government and expelling the French, restoring Ferdinand I to the throne. He took no part in public affairs during the second French invasion, but after the restoration of the Bourbons was in favor at court and for a short period in 1822 was a royal minister. Consult Sacchinelli, D., 'Memorie Storiche Sulla vita del Cardinale Fabrizio Ruffo' (1836); Von Helfert, 'Fabrizio Ruffo: Revolution und Gegan — Revolution von Neapel' (1882).

RUFINUS, roo-fi'nûs, Tyrannius, Latin ecclesiastical writer and presbyter: b. Aquileia, Venetia, about 345; d. Sicily, 410. He was converted to Christianity about 370, became a close friend of Jerome and in 379 after extended study and wandering founded a monastery at the Mount of Olives, Palestine. He was made presbyter by Bishop John of Jerusalem about 394; and took the bishop's side in the controversy with Epiphanius of Salamis over the doctrines of Origen, which action ended Rufinus' friendship with Jerome. He returned to Rome in 397 and there enjoyed the protection of Bishop Siricius, but was summoned by Anastasius, the succeeding bishop, to defend his orthodoxy and was formally condemned. He was on his way to Palestine when he died. Through his writings and translations he exerted a profound influence over the Western Church, as he not only made available the writings of the Greeks, but by his translation preserved several valuable works which otherwise would be lost. He made a rather free translation of the 'Church History' of Eusebius and brought the history down to the reign of Theodosius the Great. He also translated several exegetical works of Origen; the 'Peri Archon'; the 'Apology of Pamphilus'; the 'Homilies' of Basil'; 'Canon Paschalis of Anatolius Alexandrinus'; and many other works. He was author of 'Apologia pro fide sua'; 'De adulteratione Librorum Origenis'; 'Historia Eremitica'; 'Expositio Symboli,' etc.

RUGBY, England, a market town of Warwickshire, 81 miles by rail northwest of London. It is picturesquely situated on an eminence south of the Avon and is celebrated for its public school. (See RUGBY SCHOOL). The parish church recently restored, the modern municipal offices and the free public library are other noteworthy features.

RUGBY, Tenn., the place in Morgan County, about 140 miles north of Chattanooga, where Thomas Hughes (q.v.) and others from England established a colony in 1880. They purchased a large tract of land, laid out a town, divided the remaining portion into farms and parks and established several industries. It is in a rich mining and agricultural region on the Cumberland plateau. The settlement proved a failure; but the place is now a health resort.

RUGBY SCHOOL, a famous English public school founded in 1567 by Lawrence Sheriff, who bequeathed for its support property in Manchester square, London. Until the second quarter of the 19th century its importance was local in character, however, but under the headmastership of Arnold (q.v.) 1828-42, it became one of the greatest schools of England,— to be ranked with Westminster, Eton and Harrow. Among famous headmasters who followed Arnold are Archbishop Tait, the late Dean Bradley of Westminster, the late Archbishop Temple and John Percival, bishop of Hereford. The roll of distinguished Rugby scholars is a long one; among them may be mentioned Matthew Arnold, Dean Stanley, Landor, Clough, Thomas Hughes, author of 'Tom Brown's School Days,' Dean Vaughan and Lord Derby. Under the mastership of Dr. Temple (1857-69) the chapel was rebuilt, a gymnasium erected and other new buildings added, while under Dr. Jex-Blake (1874-87) still more building was carried on and Rugby is to-day particularly modern in the character of its edifices, which are Elizabethan in style and in appointments generally. Consult Goulburn, 'The Book of Rugby School' (1856); Hughes, 'Tom Brown's School Days' (1857); 'Life of Thomas Arnold' (1860); Bloxam and Payne-Smith, 'Rugby: its School and Neighborhood' (1889); Rouse, 'History of Rugby School' (1898).

RUGE, roo'gě, Arnold, German Socialist: b. Bergen, Prussia, 13 Sept. 1802; d. Brighton, England, 31 Dec. 1880. He was educated at Heidelberg, Jena and the University of Halle, where in 1830 he became a professor. His first literary production was a translation of Sophocles' 'Œdipus in Kolonos' (1830). He was later identified with the founding of the 'Hallesche Jahrbücher' and became known as an advocate of radical doctrines. In 1843 he went to Paris where he was associated with Karl Marx and there published his 'Zwei Jahre in Paris.' In 1847 he started a journal, *Die Reform*, in Berlin. Accused of complicity in the Revolution of 1848, he fled to England. He was there identified with Mazzini and Ledru-Rollin in their efforts to organize a democratic league for the establishment of political equality throughout the world. The movement to unite the provinces of Germany in 1866-70 was strengthened by his sympathy and his services in this cause were recognized by the German Empire. He published 'Political Pictures' (1848); 'Our Systems' (1850); 'In Former Times' (1862-67); and a 'Manifesto of the German People' (1866).

RÜGEN, rü'gën, an island belonging to Germany, in the Baltic Sea, area, 377 square miles. The coast has many indentations; on the northeast the island terminates in a chalk cliff, nearly perpendicular and about 400 feet above the water. Peculiarly shaped boulders

are found on different parts of the island. According to Tacitus, the ancient Germanic goddess Hertha (Earth) was worshipped here at Hertha Lake. The soil is fertile; agriculture, stockraising and fishing are the chief occupations. The coast villages are popular sea-bathing resorts. Bergen is the capital. Pop. 46,800.

RUGENDAS, roo'gën-däs, Georg Philipp, German painter: b. Augsburg, 1666; d. there, 1742. His right hand becoming disabled he painted and engraved with his left. He exposed himself to the fire and carnage at Augsburg that he might delineate the scene.

RUGER, roo'gër, Thomas Howard, American army officer: b. Lima, N. Y., 2 April 1833; d. Stamford, Conn., 3 June 1907. He was graduated from West Point in 1854, studied law and in 1855-61 was engaged in practice. At the outbreak of the Civil War he was appointed lieutenant-colonel and was prominent in numerous engagements. He suppressed the draft riots in New York in 1863, was in command of a division at Gettysburg, served under General Sherman and in 1864 was brevetted major-general of volunteers. He was mustered out of the volunteer service in 1866, and in that year was appointed colonel in the regular army. In 1868 he was military governor of Georgia, superintendent at West Point in 1871-76 and in 1876-78 was in command of the Department of the South. He was promoted major-general in 1895 and in 1897 was retired.

RUGGLES, rüg'lz, Samuel Bulkley, American lawyer: b. New Milford, Conn., 11 April 1800; d. Fire Island, N. Y., 28 Aug. 1881. He was graduated at Yale in 1814 and was admitted to the bar of New York in 1821. He was elected to the State legislature in 1838 and secured the enlargement of the Erie Canal through borrowed funds instead of waiting for the money to be collected by tolls. He was president of the board of commissioners for the canal in 1840-42 and in 1858, and was United States delegate to the International Monetary Conference held at Paris in 1867. He laid out Gramercy Park, New York, in 1831 and presented it to the surrounding property-owners to be maintained as a private park, and was also connected with the planning of Union square. He was author of many papers concerning the Erie Canal, and on legal and financial topics.

RUGGLES, Timothy, American lawyer, politician and loyalist: b. Rochester, Mass., 20 Oct. 1711; d. Wilmot, Nova Scotia, 4 Aug. 1795. He was graduated from Harvard in 1732, represented Rochester in the General Court in 1736, opened a law office at Sandwich, Barnstable County, and was connected with many cases of local importance in Plymouth, Bristol and Barnstable counties. Subsequently he removed to Hardwick. In 1755 he was second in command to Sir William Johnson at the battle of Lake George, in 1756. was made judge of the Court of Common Pleas of Worcester County, and represented Hardwick in the General Court. In 1762-63 he was speaker of the house, and from 1762 until the Revolution chief justice of the Court of Common Pleas in Worcester County. He served with distinction in 1759-60 in the expeditions against Quebec

and Montreal, and in recognition received the sinecure post of surveyor-general of the king's forests. He was a delegate in 1765 to the Stamp Act congress at New York and was elected its president. Upon his refusal to forward to Great Britain the addresses and petitions passed by the congress, he was reprimanded by the General Court. From that time he was identified with the royalist cause. In 1774 he was made mandamus councillor, and in consequence was forced for safety to flee from Hardwick to Boston, then garrisoned by the British. He made some efforts to recruit a loyalist corps, and in 1779, on the departure of the British troops, went with them to Nova Scotia, where he became a proprietor of the town of Digby. He was a scholar and wit and an excellent, though aggressive, pleader. Consult Washburn, Emory, 'Sketches of the Judicial History of Massachusetts from 1630 to the Revolution in 1775' (Boston 1840).

RUGS, Oriental. History.—The origin of the floor coverings, popularly known as Oriental rugs, is a matter of tradition and, therefore, purely suppositional, for the fragmentary record of the ancients, on this subject, is casual and exceedingly incomplete.

Undoubtedly, however, along with the slow evolution of human progress, rugs, in some form, filled their proper places in the scant household furniture of primitive man.

An old Hebraic tradition ascribes distinction of skillful spinning of wool and weaving of cloth to Naamah, daughter of Lamech, who was a near descendant of Adam, thus placing the handicraft of weaving close to the Biblical account of the beginning of the human race.

It is not at all improbable that Egypt, the successful producer of many useful industries of the ancients, improved the crude handiwork of her predecessors, for we possess records of rugs on her rock-cut tombs, carvings and monuments, some of which date as early as 27 centuries B.C.

Other wall paintings, stone carvings and monuments in the Euphrates Valley indicate clearly that the dwellers of these regions, such as Chaldeans, Assyrians, Armenians and Persians were the first to use the rug for floor coverings, wall hangings, tomb coverings, awnings and for devotional purposes, and that afterward the conquerors of these peoples, the Greeks, Romans, Turks, Turkomans and Saracens took up the industry and spread its popularity throughout their dominions.

Ancient Authorities.—Besides Biblical writers, among the ancients who mention rugs and carpets are included Diodorus, Ebers, Homer, Plautus, Horace, Pliny, Josephus, Arrian and almost all writers of note; but as stated above, not one of these famous men imparts definite information concerning the industry.

Introduced into Europe.—While very little is known concerning the rugs of the ancients, our knowledge takes definite shape and grows in volume along with the triumphant march of the religion of Mohammed the great prophet of Arabia, whose enthusiastic followers went from victory to victory till they threatened the very existence of mediæval Europe.

Rug making was introduced to Europe by the Moors, whose palaces and mosques in Cor-

dova, Granada and Castile were adorned with magnificent carpets, and later, when the Crusaders returned from their wars against the followers of the Crescent, they brought back with them not only a powerful desire for Oriental luxuries, but a knowledge of Oriental handicrafts, most important among which were rug and carpet making.

Thus, in about the latter part of the 13th century A.D. rugs were introduced in Europe as objects of wonderful ingenuity and of great value.

From that time interest in rugs from the Orient has constantly increased among all civilized peoples till to-day they rule supreme as the most desirable and most artistic floor coverings in the world.

Process of Making.—The general process of rug making of to-day is as old as when it was described first by ancient writers. To-day rugs are made by the descendants of the first rug makers in the same crude and primitive fashion. Nothing has been changed—nothing could be changed—for the process is so absurdly rudimentary that it precludes improvement. In the use of material, dyes and implements there has been no alteration made since before the period when Cleopatra was presented to Cæsar wrapped in a magnificent carpet.

(a) *The Loom*, more properly the frame, on which a rug is to be made, consists of two perpendicular poles (not infrequently two trees) driven in the ground at a desired distance from each other; to these are fastened two horizontal bars, one on top, the other at the bottom of the poles.

(b) *Tools.*—It is an absurdity to dignify by the name of 'tools' a crude wooden or iron comb and a pair of common shears, which about conclude the description of the 'machinery' of rug making; no other implement is required for the production of the finest Oriental rug.

(c) *The Warp.*—The warp of a rug consists of a desired thickness of thread or twine of wool, cotton, linen, hemp, goats' or camels' hair, and in some cases silk, which is stretched, back and front, upon the horizontal bars of the frame, at even spaces, to form the foundation of the rug.

(d) *The Weft.*—Before actual tying of the colored yarn to the warp, the maker weaves the salvage of a diaper, beginning at the bottom of the warp. To do this he introduces a shoot of hemp or wool or cotton by means of a treadle and crossing the warp, which is repeated until a desired width is woven; then he beats this down with his comb. This cross warp, introduced after each row of the knotted yarn, is called the weft of the rug, which very often determines the fineness and the strength of the finished article.

(e) *The Knotting.*—All Oriental rugs are actually tied to the warp—tuft by tuft separately—these are tied by hand; so, properly speaking, rugs are not woven, but built, tied, knotted. This part of the process requires great skill, accuracy and more than Job-like patience.

Two ways of knotting are employed throughout the Orient in rug making: (1) The Persian (Sehna) knotting; (2) the Turkish (Ghiordéz)

knotting. The Persian knotting consists in winding the two ends of the yarn around two separate threads of the warp, and bringing the two ends of the yarn to the surface from between each space of the warp. The Turkish knotting consists in winding the two ends of the yarn around two separate threads of the warp alternately and bringing the two ends to the surface between every two threads.

The Yarn.—Almost every woolly animal and hairy beast contributes its quota to the floor covering of the Orient, and cotton, hemp and linen, in some cases silk, and even gold and silver threads are used to bind together the "flowing lines of beauty" of the rug.

In the inaccessible fastness of Kirman, the vast mountain chains of Kurdistan and in the enchanting valleys of Shiraz and Kashmere and Euphrates, countless flocks of sheep yield the finest wool, not to mention the soft and downy wool raised in the shadow of Ararat in Armenia, and under the shelter of Demavend in Persia; and the camel of Arabia and the goat of Angora and of Bokhara vie with each other in their contribution of marvelous hair, which is transformed into bits of scintillating gems in the hands of the skilful artist of the Orient.

The wool, after being sheared, is washed thoroughly and sorted and carded upon crude wooden or iron rakes and afterward spun very much after Mr. James Bryce's description: "Each, (spinner) like the fates of Catullus, bore a distaff in her hand, with a lump of wool upon her wrist, and this they plied as they drove their flocks before them." And, when thus the wool is spun, it is made into skeins ready for the dyer's vat.

The Dyes.—To dye the yarn is a separate industry in the Orient, and the skilful dyer holds equal rank with the "dervish" and the conjurer—for, to extract beautiful dyes from animals, insects, trees, plants, roots, herbs, seeds, barks, flowers, berries, fruit and from every imaginable thing yielding color is no less wonderful than the feats of a howling "dervish" or the mysterious exorcism of the magician's wand.

From the old Tyrian purple, which adorned the royal vestments of the ancients, and which is a lost dye to-day, to the ordinary red madder of Asia Minor the extracting of dyes and coloring the yarn is a long-drawn process in an exceedingly primitive manner.

The usual method is to boil in water the ingredients of a given color, with their mordant of vinegar or some other acid, in an earthen pot, till the desired consistency is reached, every little while the dyer smelling and testing the liquid. Afterward the yarn in skeins is dipped in this preparation until the required shade is obtained, then withdrawn and dried in the sun. Often the dyed yarn is exposed to the influence of the elements for weeks and weeks, till in the laboratory of nature the dye becomes a permanent portion of the wool, and remains thus as long as the material exists.

There are some dyes which require no such treatment, others which must be produced in an entirely different manner, but in each case the skilled dyer knows just how to obtain best results, and left to his own resources, given his own time, he usually accomplishes the desired end.

Ornamentation.—Taking a wide survey, from the Sea of Marmora at the west to the Yellow Sea at the east, Oriental rugs may be divided into two general classes, according to ornamentation: (a) geometrical; (b) floral. The development of geometrical ornamentation is attributed to the Turanian races occupying the northeastern portions of Asia, most of whose rugs bear the stamp of a more primitive type, which lead us to believe that they are more closely related to the rugs of prehistoric times. The design, popularly known as the Swastika or filfot cross, is believed to constitute the basic pattern of all geometrical ornamentation in rugs—indeed, some authorities go further in the assertion that the Swastika was the first design used for ornamentation by the human race.

The floral ornamentation, a later and more intricate method, was adopted by the Aryan races, and carried to its highest development by people inhabiting the country lying between the Caspian Sea and the Persian Gulf.

The typical design of floral ornamentation is the "flower and knob," a conventionalized resemblance to the Egyptian lotus or the tree of life of the ancients.

An endless variety of patterns of both classes appear on rugs; they are mixed and intermingled so hopelessly that a rigid classification according to ornamentation is almost impossible.

Purely floral patterns, such as representations of leaves, trees, blossoms, rosettes, palmettes, are strewn over or under squares, circles, stars, octagons, medallions and various forms of the Swastika in a manner so blended, that a classification of rugs according to ornamentation resolves itself into an unsolvable riddle.

Symbolism.—It is stated by enthusiastic writers on Oriental rugs that a fascinating array of symbolism lies beyond those charming patterns.

The rug itself typifies the universe, and its various designs the ever-changing phenomena of life. The principal coloring of the field of the rug, if red, signifies life, victory; if blue, royalty; if white, purity; if green, devotion; if black, evil; if yellow, nobility; and so on to the end.

In patterns, the Swastika signifies auspiciousness, good luck; the flower and knob, fortune, life everlasting; the circle, immortality; the star, the Star of Bethlehem; the triangle, the charm of Solomon; the square, "the square deal"; the comb, cleanliness, etc.

Among vegetation, the rose typifies love; the lily, purity; the scarlet tulip of Babylon, passion; the blossom, innocence; the fruit, fecundity; the tree, abundance, etc.

And the star of six points represents Allah!

It is reasonable to ask, however, that this endless chain of designs having come to us from the mythological past where the light of knowledge fades in the mist of tradition, who can say positively that a certain design typifies a certain idea—and is not "one man's guess as good as another's"?

The greatest charm of Oriental rugs lies in the simplicity of construction, in the impress of individuality of effort and in the incomprehensible mystery of design. The manner of their making is primitive; the materials used

RUGS

Caucasian Rug

Indian Rug

RUGS

Persian Rug (Shiraz)

Turkish Rug

are all home made, and the ornamentations in odd lines, angles, squares or in grotesque likenesses of "fish, flesh and fowl," the original meanings of which are forever buried in the first ages of mankind—these, and the wonder of their marvelous colorings, the secret of many being still hidden and many another being entirely lost, add to the teasing witchery of the Oriental rugs.

Names.—To the uninitiated, of the many unsatisfactory peculiarities concerning the subject, the naming of Oriental rugs is the most perplexing. There is no fixed rule that would classify clearly the enormously diversified output of rugs within the vast area of about three-quarters of the continent of Asia. There are, however, six recognized geographical divisions, which include about all Oriental rugs of our day, namely: (1) Persian rugs; (2) Turkish rugs; (3) Caucasian rugs; (4) Turkoman rugs; (5) Indian rugs; (6) Chinese rugs.

Persian Rugs.—Persia, the home of floral ornamentation, and the most marvelous exponent of textile production of the Orient, stands on the pinnacle of fame by unanimous consent. She attained this enviable position especially during the benign reign of Shah Abbas, in the 16th and 17th centuries, under whose wise encouragement she reached the golden age of the rug industry.

The Ispahan rugs made under Shah Abbas, with their gorgeous field of "Ispahan red," decorated in tulip, rose, lotus, iris floriations, fastened together in chiseled tracery of refined meandering lines and angles at once puzzling and fascinating established a new epoch of the rug industry, never equalled since.

A somewhat similar pattern of the Ispahan having been evolved, the glossary of Persian rugs was enriched by another famous type of pattern which they called the "Shah Abbas," after that most honored monarch of Persia. The Ispahan rug, as a class, stands alone, and its species is almost extinct, the very few perfect specimens and even fragments being jealously preserved in museums or in private collections.

Persians, who ought to know best, divide their rugs into the following groups according to ornamentation mostly, which is different from the accepted division in common use abroad: (a) Kirman; (b) Herati; (c) Iran; (d) Hamadan; (e) Kurdistan.

(a) The Kirman group is subdivided into the following celebrated specimens: (1) Kashan; (2) Kirman or Kirmanshab; (3) Saruk; (4) Tabriz. The chief characteristics of this group lie in their extreme fineness of texture, brilliance of coloring and purely floral ornamentation, which is carried to its highest perfection.

Mostly of modern construction, but copies of some old forms, with floriated medallions or panels or scrolls, replete with vases of flowers, and representations of birds or beasts, these rugs show the scintillating splendor of jewels in textile art; and they command high prices on the American market.

(b) The Herati group includes: (1) Meshed; (2) Khorassan; (3) Shah Abbas; (4) Feraghan; (5) Joshaghan; (6) Youraghan.

To the heart of a true son of old Iran, this

group of rugs is the most precious of all, for here are preserved the glorious traditions of his forefathers; here, the holiest shrine of his faith; here, the revered name of his most illustrious shah and, here, the true splendor of his matchless artistry. The chief excellence of this group is in the development of the leaf pattern; be it the palm leaf, the rose leaf, the lotus leaf or the so-called river-loop design; it fills a very prominent part of ornamentation either in a curled position as in the Feraghan, or spread out on borders, corners and medallions as in the Meshed and Khorassan, or in groups and clusters of splendid tracery as in the Shah Abbas.

(c) The Iran group contains the following popular specimens: (1) Teheran; (2) Mihr; (3) Saraband; (4) Shiraz.

Most worthy of mention and very much admired by all Orientals are the Saraband and Shiraz rugs, besides the Mihr, which really is the finest grade of Saraband.

The characteristic peculiarity of these, especially of the Mihr and Saraband, is the palm leaf pattern, row upon row, on a field of red or blue but seldom ivory, each row of palm leaves facing in an opposite direction.

In the Shiraz rugs the palm leaf design, if employed at all, is used without regard to regularity or size. The Shiraz rugs show an utter disregard to conventional patterns, therefore they are among the most interesting rugs of the Orient. Often medallions run through the centre which are decorated with flowers, leaf patterns, birds and animals much after the style of Kirmans. But the distinguishing points are: the salvages overcast in two or more colors with tassels here and there and the two ends finished with pretty needlework patterns.

In the Teheran the patterns may or may not show the palm, but they are kindred rugs in all other respects.

(d) The Heriz group contains: (1) Ardebil; (2) Hamadan; (3) Bakhshaish; (4) Gorovan; (5) Serapi.

In these rugs, the medallion with its various modifications is carried out in a most pronounced fashion; especially in the Gorovan and Serapi, where the medallion stands out in barbaric outline upon a field of red, white, blue, green or brown hues of great brilliancy.

In the Heriz and Hamadan, the undyed hair of the camel plays a prominent part, often covering the whole rug, decorated with rosettes, medallions, pendants and heavy traceries, all interwoven in bold contrasts. In the Ardebil and Bakhshaish and the Heriz proper, these striking contrasts are entirely eliminated, indeed, these show such superb mellowness of coloring, graceful lineations and superior floriations, that they bespeak of times of long ago.

(e) In the Kurdistan group are included the following specimens: (1) Sehna; (2) Bijar; (3) Lullé.

It would seem that the Sehna rug should not fall under this heading, for there is no similarity of style or texture to the Kurdistan; but the people of Persia class this rug as a Kurdistan.

The Sehna, so far as fineness of texture is concerned, belongs to the Kirman group,

and not infrequently surpasses even the best Kashan texture of the Kirman group. Hundreds of knots are crowded in a space of one square inch with shortest cut yarn until it becomes almost beyond belief that human fingers are capable of producing such a fabric.

The Sehna rug shows no reckless disregard for design or color; whether rosettes or palm patterns or medallions, every line is clear-cut, every curve masterfully rounded and every color faithfully reproduced. The Sehna is the thinnest rug made in the Orient.

In strongest contrast to the Sehna are the Bijar and Lullé of the Kurdistan; they recognize no established pattern; accept no school of coloring and follow no rule of texture.

Generally thick and heavy in texture, employing all the standard Persian designs without regard to fitness or uniformity of position on lustrous fields of rich and deep coloring; whether coarse or fine, heavy or light, these rugs compel admiration by reason of their extraordinary solidity.

Turkish Rugs.—In the Turkish Empire live many races, peoples and religions, which are not at all affiliated with one another—remnant nations of Syria, Babylonia, Armenia—Chaldea, Greece, Palestine, etc.—consequently, the textile productions of this region are somewhat mixed and rather difficult to classify. It appears, however, that the Turkish detached mode of ornamentation repeated on some parts of rugs, and the generous use of both floral and geometrical designs usually seen in all Turkish products, would give them a certain distinction; add to this the very popular pattern found in the prayer rugs, and the Turkish rugs become an individual class in the family of Oriental rugs.

Moreover, most Turkish rugs are coarser than Persians, their pile being longer, looser, thicker and softer.

The people of Turkey divide their rugs into the following principal specimens: (a) Ghiordes (Yordez); (b) Koulah; (3) Ladik; (d) Melez; (e) Berghama; (f) Koniah; (g) Kir-Shehir; (h) Kutahia; (i) Mousul; (j) Kurd; (k) Yuruk; (l) Anatolian.

(a) In conception of design, execution of workmanship and combination of coloring, the Ghiordes stands first in all Turkish rugs, and is most highly praised by Turk, Greek, Armenian, European and American alike.

Usually made of prayer-rug designs, the field has a solid coloring of ivory, blue, red, sometimes green, with the niche or dome resting on two ornamented columns; but at times the columns being absent, the dome is supported by highly conventionalized patterns of the tree of life.

A wide border, generally of the same coloring as of the field, is decorated with flowers and configurations so clustered as to form a superb square, which is repeated on the four sides of the rug, and frequently on the panels, over and under the enclosure of the praying niche pattern.

Two or several narrow borders in detached patterns surround the principal border; and on the two upper corners filling the trigonal spaces of the praying dome, are distributed figures bearing a resemblance to the main border. Often a bejeweled lamp hangs down from the centre of the dome.

The colorings of the Ghiordes of old are impossible to describe appropriately, and it might be added with truth, equally impossible to reproduce in color.

(b), (c), (d) Koulah, Ladik, Melez, these three are kindred rugs to the Ghiordes, but they are not equal to the latter.

In Koulahs, the praying dome is often indented or otherwise misshapen, and the field, instead of a solid color, is decorated with patterns. It is marked also with several narrow stripes, for border, with startling contrast of colors.

The Ladik may be called a better rug than the Koulah, for it often possesses beautifully subdued greens, deep reds, blues, all bleaded attractively.

The Melez might be named as twin sister to the Ladik, for it has all her characteristics, and only the trained eye can properly distinguish between them.

(e), (f) Berghama and Koniah rugs generally show medallion designs and a field well covered with geometrical patterns; they have also wide attractive borders covered with floral decorations. In form these rugs are made nearer square than other Turkish productions, with a heavy, silky pile and very attractive colorings.

(g) The Kir-Shehir products, prayer-rug design or other, generally small rugs possess much resemblance to Ladik and Melez, they are, however, coarser rugs with brighter colorings and with unpleasant contrasts.

(h) Kutahia, or Kutais, is a longer rug than the foregoing specimens with no special characteristic in design or coloring. A satisfactory rug usually, with silky surface, pleasing design and fine coloring.

(i), (j), (k) Mousul, Kurd, Yuruk. Strictly these three grades do not belong to the Turkish family of rugs, yet neither could they be classified under the Persian group, and since the provinces in which they are made fall under Turkish rule it is proper to call them Turkish.

In design, in texture, in workmanship, these are the "heavy-weights" in rugs. There is coarseness, boldness and a wild strength in these rugs, which indicate the mountain, the desert and the ravine; usually made of good wool and of good coloring (often exceptionally good), they lack the refinement of a Herati or the exquisiteness of a Ghiordes.

The Kurd and the Yuruk, especially, show an utter disregard for regularity of design or texture; sometimes long and shaggy like the matted wool of a sheep, they defy any accepted school of rug making.

(l) Anatolian.—There are several other grades made in Turkey, especially small mats, which are covered by this name. The Anatolian rug is usually of heavy quality and not very fine, but in coloring surpasses many others. The wool is exceedingly soft, and the colors frequently of primary dyes, and when mellowed by age, it develops a sheen which rivals silk productions.

Caucasian Rugs.—In Caucasian rugs, the geometrical ornamentation is carried to its perfection. All conceivable designs in line are employed with great profusion and bewildering effect. Generally there is one principal color to which all other colors are subjected in clear-

cut designs, sometimes without shading, giving the effect of inlaid stonework.

In texture Caucasian rugs are medium, although there are some exceedingly fine specimens made, but these are exceptional.

In size these rugs are not very large, sometimes they are made long and narrow, but mostly of medium size.

In designing they show star shapes, circles, fretwork, insect shapes, diamonds, triangles, various forms of the Swastika, squares, medallions, dragons designs, etc.

These are the following principal well-known kinds of rugs made in Caucasia: (a) Daghestan; (b) Kabistan (Kuba); (c) Shirvan; (d) Darbent; (e) Karabagh; (f) Kazak; (g) Chichi; (h) Circassian; (i) Kashmir (Soumak).

The Daghestan, the Kabistan and the Shirvan are rugs made on similar lines. Their colors, designs and texture are not different from each other, except the Kabistan, which is usually of finer construction. The geometrical elongated star and the Swastika and other lineal decorations are common to all, with beautifully vivid colors attractively arranged.

The Darbent rug shows a strong, barbaric nature like that of the Kurd and Yuruk, only in the Darbent there is more uniformity of design, and the texture is not so coarse.

The Karabagh rug shows more of the Persian mode of designing than any other Caucasian rug. Upon its black or brown field are strewn, at regular distances, magnificent delineations of leaf and flower patterns in various shades of tan and old magenta colors—but this is the Karabagh of olden times. The modern product is a mixture of homely designs, crude dyes and coarse weaving, showing a careless haste in workmanship.

The Kazak rugs are the heaviest of all Caucasians and different in floriation. It appears that the makers of these rugs have endeavored to develop the gruesome in design, for on their products are shown various grotesque shapes of the dragon and other creeping creatures with startling effect. One distinguishing point of Kazaks is in their size which is nearer square than any other Caucasian product; another is in the peculiar quality of the twisted yarn, which, when untwisted after years of usage, is divided into hundreds of fine ends making the surface of the rug like a smooth velvety lawn.

Chichi rugs are made fine usually, and differ from other Caucasians in ornamentation. On a dark or light colored field are distributed regular patterns in cut squares or rectangular forms, giving the appearance of a latticed panel.

Circassian rugs depart entirely from Caucasian mode of ornamentation. These are among the choicest, if not the choicest products of this region. A favorite design consists in a pattern of superb flowers in full bloom, or foliage artistically clustered and connected one with the other by graceful long lines.

Kashmir (Sumak or Shamakha) rugs are devoid of nap; they are made in what is commonly known as the flat stitch style like the old Kashmir shawls of India from which they derive the name. In design they are typical Caucasians, and by reason of the absence of the nap they show their designs in bold relief, clear cut and prominent. The long ends of the yarn,

left on the back, give weight and softness of texture.

Turkoman Rugs.—There are two divisions of the Turkoman rugs: Western and Eastern. In the Western Turkoman rugs the chief color, universally employed, is red with all its shades and kindred colorings, and the principal design, the octagonal or Bokhara; embracing the following well-known specimens: (1) Bokhara; (2) Afghan, or Khiva; (3) Yomud; (4) Bushir; (5) Beluchistan.

Of these, Bokhara rugs are the finest and most valuable. It is impossible to mistake the Bokhara after once seen. The octagonal device, in shades of blues, ivory and reds, is stamped on every Bokhara upon a field of some shade of red. The octagonal pattern is divided into four, with the diagonal sections resembling each other. They are the finest of all Turkomans in texture and sometimes so fine that they rival the best productions of Persia.

The prayer-rug of this class preserves the general characteristic color of red. It, however, shows no octagonal device; there is the usual dome pattern in a more pointed shape near the top; and the whole rug, usually about four feet by five, is divided into four sections, decorated with highly conventionalized devices of the Swastika.

Afghan or Khiva rugs, made of coarser texture and of larger size, adhere to the Turkoman red and octagonal pattern most faithfully—in the large regularly arranged octagon is often seen clover leaf and sometimes a portion of dragon designs. Rich in coloring, heavy in pile, these rugs frequently mellow into lustrous and velvety fabrics.

The Yomud rugs are of darker shades of the maroon; and the detached regular octagon is transformed into an elongated diamond design fringed with dragon claws or Swastika devices. The Yomud usually is of very fine texture and is made in large size.

Bushir rugs classed herein are Turkoman only in coloring and texture. They show no octagonal pattern; often being decorated with palm devices; sometime with Herati designs, and with ornamentations generally found in Caucasians. Made in rather longish sizes, loose texture, strong, silky and desirable.

Beluchistan rugs are another class of the Turkomans which bear no resemblance to the Bokhara. Generally small in size, they deviate from the red shades often, and show subdued shades of maroon, blue, ivory, camels' hair and, rarely, green. In design they employ the floral as well as geometrical forms. The general effect of Beluchistans is dark.

Eastern Turkoman rugs may be subdivided into: (1) Ganji or Genghis; (2) Samarkand; (3) Kashghar; (4) Yarkhand.

The Ganji rugs are made by Turkoman nomads, of goats' hair or wool with long silky texture, the principal color being white or yellow, on which are spread at regular distances rather crude geometrical devices.

Samarkand rugs reveal Chinese characteristics in coloring and design—usually of yellow, tan or red and blue, they have several round figures intersected with strange floral designs and geometrical patterns.

The fret decoration is pronounced on their borders. Heavy and rather coarse in construc-

tion these rugs are attractive by reason of their simplicity of designing and uniqueness of coloring.

Kashghar rugs, coarse in texture, are stolid in design and simple in coloring. Often only three different colors appear—a solid color for the field, another solid color for the simple geometrical design and a third to separate the lines and to mark the borders. These and the Yarkhand rugs similar to these rarely leave their native places, the easternmost part of Turkestan.

Indian Rugs.—Strictly speaking India sends out only large carpets, the manufacture of which is in the hands of European and American firms, who have established great centres of production in the Punjab, Kashmir and Madras districts, commonly known as Agra, Lahor, Amritsar, Mirzapur, Kandahar, Ardahan, etc. Arbitrary names these last, given by the manufacturers themselves without regard to location.

These American and European houses not only control the output of rugs but also their ornamentation and coloring; they make rugs to order, according to the colors selected and patterns required by their customers. Thus individuality and character is altogether wanting in these productions, albeit they are made to endure, being heavy, closely woven and of attractive colorings.

Mr. Ruskin sums up the deteriorating effect of European control on the Indian rugs in the following manner: "Modern commercialism has laid its poisonous trade upon this useful industry since the days when I was a young man and to-day it is almost ruined as an art."

It may be added that to-day "this useful industry . . . as an art" is altogether ruined with no hope of its revival.

Chinese Rugs.—It is a matter for the historian to decide whether or not the Chinese are the original rug makers of the world; it is evident, however, that rugs were made in China a very long time ago and some of them of surpassing beauty; thus the white silk rug taken to Mecca as a covering for the holy shrine of Kaaba antedated by hundreds of years the appearance of the great prophet of Arabia.

Chinese rugs form a distinct type, their designs consist of all kinds of odd geometrical devices, all imaginable curves and angles and many quaint configurations of the Swastika or the lotus flower which are distributed with unique formations on fields of yellow, blue, red, fawn, gold and tan in all their exquisite shades marvelously blended.

The Chinese mode of ornamentation may be called the kaleidoscope of texture. Generally of long, soft wool or silk or camel's hair these rugs while not made as fine as some Persian rugs, still reveal masterly skill in texture with iridescent sunset colors and magnificent sheen. They are among the most valuable of all Oriental rugs and among the rarest on the European or American market; and they command the highest prices.

Kilims.—Kilims, while products of the Orient, are not rugs, for they possess no pile and their mode of construction is different.

Kilims resemble the Kashmir or Shemakha rugs and are made in the same manner, that is on the flat stitch plan, with this difference, however, that while the loose ends of the yarn

are left on the back of Kashmir rugs, in Kilims they are wound around the woof, and in changing the yarn to change the color also a separate warp thread is taken up, thus leaving a small oblong open space between the two stitches. Kilims thus made present the open work effect in texture.

Kilims are of lighter weight, often both sides being alike and are not appropriate for floor coverings. They are the tapestries of the Orient, and in whatever district made they follow the usual rug pattern of that district. The finest Kilims are made in Sehna, where the finest rugs are made, in Persia; and also in Bokhara. Small Kilims made in Turkey are often called Kiz-Kilim; woven by the hands of Turkish maidens for purposes of dowry or devotion, or for presents to their marriageable friends and relations, they are, therefore, highly decorative and often with unusually beautiful designs. Kilims are made also in Caucasia and Kurdistan known as Shirvan and Kurd Kilims respectively.

In the Orient their use is manifold—as rugs, hanging both for doors and walls, and for tents, as mantles by day time and covering by night for travelers; made for bags and covering for bags, and also for covering of the person; they serve for other conveniences entirely unknown in civilized communities. See PRAYER RUG.

B. PESHMALYAN.

RUGS, Weaving of. The commerce in Oriental rugs in the United States, especially those from Persia, Russia and Turkey, is very considerable. A few came from India and China, and some are woven in Afghanistan and Beluchistan. While there is a large production of rugs of various kinds in America, the imported rugs continue to hold high favor among American buyers. Many of the costly Eastern

rugs are as simply woven as a Navajo blanket, an Indian product, or even as a rag carpet. The process is in many cases, almost identical, the variation being only in closeness or fineness of warp and arrangement of color. The manufacture of rugs in the United States is an industry of considerable importance. A great variety of weaves is produced — woolen, cotton and grass rugs, in some cases after European models and methods and in others after original designs and methods of construction, both as to the machinery used, the dyeing of the fabrics and the designs. Grass rugs for the country house have recently won prominence in our domestic commerce. Some of these are made of tough fibres and others of less durable material. Some have their colors woven into the mesh and some have stencilled designs in fast colors.

Another phase of the weaving of rugs in the United States is their manufacture in the home. Rag carpets have been made and used in farmhouses for many generations, but of late there has been a general demand, especially in country houses, for home-made piazza rugs, bedroom rugs and rugs for general use. An authority on the home weaving of rugs is Mrs. Candace Wheeler, whose recent work on 'How to Make Rugs' is a practical handbook. In it the Onteora, the Lois, the Isle La Motte, the Lucy and other home-made designs are described. The pattern, the dyeing and braiding the fringe of the border all are featured in detail. This writer states that "the cumbersome old woolen loom is still doing a certain amount of work in every country neighborhood, and is capable of a greatly enlarged and much more profitable practice. I find very little, if any difference in the rugs woven upon these and the modern steel loom. It is true that the work is lighter and weaving goes faster upon the latter, and where a person or family makes an occupation of weaving, it is probably better to have the latest improvements, but it is possible to begin and to make a success of rag-rug weaving upon an old fashioned loom." In the matter of pattern and coloring it is stated that the Onteora rug is made by using a proportion of half a pound of blue rags to the two and a half white required to make up the three pounds of cotton needed in a six-foot rug. The side border in the Lois rug is made upon the same blue warp, is separately woven and afterward added to the plain white rug with blue ends. Many of the rugs described by Mrs. Wheeler are washable. Her work also has been the building up of neighborhood industries in domestic rug making, a labor which has taught both economy and art.

The larger subject of the domestic manufacture and commerce in rugs made in the United States may be broadly considered under the general subject of carpets (q.v.). The principal varieties of carpets now in use are the Turkey, the Axminster, the Brussels, the Wilton, the Venetian, the Dutch, the Kidderminster or Scotch, the Whytock's tapestry and velvet pile, and the printed felt carpet. Generally speaking, rugs, whether made in England or the United States, have somewhat similar designations and are similar in appearance though made on the most modern looms. A very beautiful fabric has also been introduced, called the Patent Wool Mosaic,

RUHMKORFF, room'kôrf, Heinrich Daniel, German inventor: b. Hanover, 1803; d. Paris, 21 Dec. 1877. He removed to Paris in 1839, where he continued to reside. In 1851 he invented the induction coil which bears his name.

RUISDAEL, rois'däl, or **RUYSDAEL**, Jacob van, Dutch painter: b. Haarlem, 1626; d. there, 1682. He was the son of a painter and probably studied art under his father and an uncle, who was also a painter. In 1648 he entered the guild of his native city and some nine years later settled in Amsterdam, where he received citizen rights in 1659. He appears to have traveled throughout his native country and in parts of Germany and Switzerland. Ruisdael was not much appreciated during his lifetime, but is now ranked among the greatest of the Dutch landscape painters. His pictures, comprising well-chosen forests, waterfall, shore, mountain and similar scenes, are often of a melancholy, but always of a deeply poetical character. The figures in them were painted by Berchem, Van de Velde, Van Ostade, Wouwerman, Lingelbach and others. All the chief European galleries contain examples of his work, the number in the National Gallery being 12. Consult Michel, 'Jacob Van Ruisdael et les Paysagistes de l'Ecole de Haarlem' (1890).

RUIZ, roo-eth, Juan, Spanish poet: b. about 1283; d. 1350. He is frequently called the archpriest of Hita. Very little is known of his life; and the time and place of his birth are uncertain, Guadalajara and Alcolá (de Henares) both claiming to be the latter; for honor it certainly is since he is easily the greatest of the early Castilian writers. It is known that he was cast into prison by order of Cardinal Don Gil, archbishop of Toledo, and he probably died there. At any rate he seems to have remained in prison some 13 years and to have composed most of his works there. His poems are stamped with the immorality of the age, but they are simple, imaginative, varied in form and very wide in range of subject. Throughout them are freely scattered fables, sayings, precepts and proverbs that have become an integral part of the Spanish language, if indeed most of them had not already attained to that distinction before Ruiz wove them into his poems. His 'Libro de buen amor,' which seems to have been written while he was in prison, shows a considerable variety of talent, power of expression, breadth of imagination and ability to seize upon the interesting, picturesque and graphic. Ruiz possesses strong satirical humor and boldly attacks the vices of his day even in the body of the Church, while at the same time showing himself as devoid of any moral standard as those he holds up to ridicule. He is at times reflective and devotional; but this is far from his customary mood; it is rather one of licentious immorality which instead of attempting to hide or gloss over, he rather glories in. The fact that a priest could openly express himself as Ruiz does, offers an excellent commentary upon the customs and the morals of the age. Ruiz is a skilful versifier and his genius is more universal than any of his contemporary countrymen. In fact he has frequently been compared to Chaucer. But while he has much of the vivacity of Chaucer and his ability for narration, he has not his

power of character painting. He strikes the personal note in a way never attained by Chaucer, and which reminds us in some respects of Byron. Ruiz is even bolder and more cynical in his burlesques of the priests and the Church. The whole paraphernalia of the Church, including "clerks and laymen, monks, nuns, duennas and gleemen," he sends forth to meet and welcome love at Toledo. In his bold humor he fears nothing and dares everything. Everywhere he strikes the personal note; and his verse and his thoughts flow with freedom heretofore unknown in Spanish literature. Consult Cejador y Frauca, J., 'Juan Ruiz' *Libro de buen amor*' (annotated ed., Madrid 1913); Ducamin, J., 'Libro de buen amor de Juan Ruiz' (Toulouse 1901); Fitzmaurice-Kelly, 'Chapters on Spanish Literature' (London 1908); Ticknor, G., 'A History of Spanish Literature' (New York 1854).

RULE, William Harris, English Wesleyan Methodist clergyman and historian: b. Penryn, Cornwall, 15 Nov. 1802; d. Addiscombe, 25 Sept. 1890. He was practically self-educated and was ordained in 1826. In the succeeding year he was resident missionary at Malta and in 1827-31 he was missionary at Saint Vincent, West Indies. He was pastor at Gibraltar in 1832-42, and held pastorates in England in 1842-68, serving as chaplain at Aldershot Camp in 1857-65. He was supernumerary pastor at Croyden after 1868. In 1851-57 he was joint editor of the Wesleyan publications. He was a man of high linguistic attainments and is said to have mastered 10 languages. Author of 'Memoir of a Mission to Gibraltar and Spain' (1844); 'Martyrs of the Reformation' (1851); 'Celebrated Jesuits' (2 vols., 1852-53); 'The Religious Aspect of the Civil War in China' (1853); 'History of the Inquisition from the Twelfth Century' (1868; 2d ed., 2 vols., 1874); 'Councils, Ancient and Modern' (1870); 'Recollections of Life and Work at Home and Abroad' (1886), etc.

RULE BRITANNIA, one of the national songs of Great Britain, the joint production of James Thomson and David Mallet, first performed before Frederick, Prince of Wales, at Cliefden House, 1740. It runs as follows:

When Britain first at Heaven's command
Arose from out the azure main,
This was the charter of her land,
And guardian angels song the strain:
Rule, Britannia! Britannia rules the waves!
Britons never shall be slaves.

The nations not so blest as thee
Must in their turn to tyrants fall,
While thou shalt flourish great and free,
The dread and envy of them all.

Still more majestic shalt thou rise,
More dreadful from each foreign stroke;
As the loud blast that tears the skies
Serves but to root thy native oak.

Thou haughty tyrants ne'er shall tame;
All their attempts to bend thee down
Will but arouse thy generous flame,
And work their woe and thy renown.

To thee belongs the rural reign;
Thy cities shall with commerce shine;
All thine shall be the subject main,
And every shore it circles thine!

The Muse, still with Freedom bound,
Shall to thy happy coast repair;
Blest Isle, with matchless beauty crowned
And manly hearts to guard the fair:—
Rule, Britannia! Britannia rules the waves!
Britons never shall be slaves!

RULE OF FAITH, the *regula fidei* of polemical theology is the term applied to what is considered the code from which the Christian faith is to be derived and has been in use since the 2d century. The items of the creed differ in the various sects. The Reformers held that the Scriptures alone could be safely accepted as the rule of faith. Roman Catholics hold that the testimony of the Church is the true rule of faith, regarding the Church as the vital and infallible organ of the teachings of Jesus Christ under the guidance of the Holy Spirit, while they look upon the Bible as the divinely inspired word of God to be interpreted by the Church. Protestants acknowledge the authority of Christ, his apostles and all inspired writers, but deny that any doctrine not contained in the Scriptures has any binding authority. Certain members of the English Church admit what they call the consent of the Fathers as authoritative in the interpretation of the Scriptures.

RULE NISI, *ní'si*, or **RULE TO SHOW CAUSE**, in English and United States law, an order granted by the court on an interlocutory application (formerly always *ex parte*), directing the party opposed to the applicant to do or abstain from some act unless (*nisi*) he can show cause why the order should not be obeyed. If cause is shown, the order is "discharged," otherwise it is made "absolute."

RULE OF THREE. See PROPORTION; ARITHMETIC; ARITHMETIC, HISTORY OF.

RULING MACHINES, in blank-book manufacture and bookbinding, are instruments used for ruling paper, metal, etc. The first machine of this kind was invented by a Dutchman, resident in London, in 1782, and was subsequently greatly improved by Woodmason, Payne, Brown and others. F. A. Nobert devised a ruling machine in 1845 for the production of microscopical test plates, diffraction gratings and micrometers, etc., and more recently Benjamin Day, a New York artist, patented one for use by artists.

RULLUS, Publius Servilius, Roman tribune of the people in 64 B.C. He is famous for his proposal of a law which provided for the purchase and distribution by the state of land for the poorer classes, thereby abolishing pauperism. The law was to be administered by a commission of 10, elected for five-year terms, and the money required was to be raised through the sale of property of the state and of lands and provinces acquired by the state since 88 B.C. The proposed law granted wide powers to the commission and was considered open to a suspicion of ulterior political purposes. It failed to become a law. One of its chief opponents was Cicero, who delivered four speeches against it. Three of these still exist, 'De lege agraria.'

RUM, a distilled liquor obtained from the fermented juice of the sugar-cane or molasses. Rum owes its flavor to a volatile oil and butyric acid, a fact which has been utilized to prepare a butyric compound called essence of rum to enable the spirit-dealer to manufacture a fictitious rum from malt or molasses spirit. The color is usually imparted after distillation by adding burnt sugar or caramel.

RUM, ROMANISM AND REBELLION, a phrase celebrated in American political his-

tory. At a meeting of clergy, in which all denominations were supposed to be represented, held in the Fifth Avenue Hotel, New York, during the Presidential campaign of 1884, in the interest of the Republicans, Rev. R. B. Burchard described the Democrats as the party of "Rum, Romanism and Rebellion." This remark was unfortunate for the Republicans and helped in a great measure to win the election for the Democrats.

RUMANIA, roo-măn'nî-ă, or **ROUMANIA**, a kingdom of southeastern Europe, bounded by Hungary, Ukraine, the Black Sea, Bulgaria and Yugoslavia. Area, 50,720 square miles. It comprised the provinces of Moldavia and Wallachia, prior to 23 Dec. 1861, Danubian principalities. The principal towns are Bucharest, the capital, Jassy, Galatz, Braila, Botosai, Ploësti, Craiova, Berlad, Focșani.

Topography.—The surface consists mainly of undulating and well-watered plains of great fertility; from the Carpathian Mountains on the north and west borders, where the summits range from 2,600 feet to 8,800 feet, they gradually slope downward to the river Danube which for 595 miles flows through Rumanian territory, and with Bulgaria forms the major portion of the southern boundary. The entire kingdom is in the basin of the Danube, the chief Rumanian tributaries of which are the Ar or Aluta, the Arjish, Jalomnita, Buzeo, Sereth, Berlad and Pruth. The Danube forms a number of marshy lakes as it approaches the alluvial region of the Dobrudja, which is mostly a land of steppes and marshes, unhealthy and uncultivated, through which the Danube discharges itself into the Black Sea by the Saint George, Sulina and Kilia channels.

Geology, Natural Resources, etc.—In the region of the Carpathians the geology is of the Tertiary period practically completed at the end of the Miocene period and almost entirely composed of primitive rocks. The kingdom possesses considerable mineral wealth; rock-salt abounds in the vicinity of the Carpathian Mountains, and the salt mines of Wallachia are apparently inexhaustible. Petroleum and asphalt are abundant; a great quantity of saltpetre is produced, chiefly in the northern part of the country; sulphur is found in more limited quantities. The only metal of importance is copper, which has been worked to some extent; gold is washed from the sands of several streams, however. About one-sixth of the surface is covered with forests of oak, fir, beech and other valuable timber trees.

The fauna includes stags, bears, wolves, foxes, wild goats, wild boars, hares and martens; while fish abound in the rivers. The climate is subject to greater extremes than at the same latitude in other parts of Europe. The summer is hot and rainless; the winter, sudden and severe, the Danube and its tributaries being regularly frozen for about six weeks; there is almost no spring, but the autumn is long and pleasant. Rumania is an essentially agricultural and pastoral state, fully 70 per cent of the inhabitants being directly engaged in husbandry. The chief cereal crops are maize, wheat, barley, rye and oats; tobacco, hemp and flax are also grown, and wine is produced on the hills at the foot of the Carpathians. Cattle, sheep and horses are reared in large numbers.

Manufactures, Commerce, etc.—Since the passing of the law in 1887 for promoting national industries some progress has been made in manufactures, chiefly along the line of domestic commodities. Trade is fairly active, but is almost entirely in the hands of foreigners; the internal trade is chiefly carried on by Jews, who are subject to certain disabilities. The chief exports are grain (especially maize), cattle, timber and fruit; the chief imports, manufactured goods, coal, etc. Germany, Great Britain and Austria-Hungary appropriate by far the greatest share of the foreign trade, the bulk of which passes through the Black Sea ports. In 1913-14 the exports were valued at \$134,141,060, the imports at \$118,002,520. In 1914 there were 2,299 miles of state railway, 5,618 miles of telegraph lines and a rapidly extending telephone system. The government monopolizes also salt and tobacco. The French decimal coinage has been introduced, the franc being called *leu* (pl. *lei*), the centime *bari*. The metric system of weights and measures has also been officially recognized, but a diversity of local standards is still common.

Government.—Since 1881 the ruler of Rumania has had the title of king, in accordance with the decision of the Rumanian Parliament. Previously the title was prince, or in Rumanian "Domnu" (Lat. *dominus*, lord). The father of the present ruler was elected by the people, but the dignity is hereditary. There are two legislative houses, a Senate of 120 members elected for eight years, and a Chamber of Deputies of 183 members elected for four years. The members of both chambers are chosen by indirect election, the first voters choosing electors, and these in their turn the deputies. A deputy must either belong to a learned profession, to a military or civil service or have an annual income of about \$2,000, and must be 25 years of age. All citizens of full age and paying taxes are electors. The sovereign has a suspensive veto over all laws passed by the two chambers. The executive is in the hands of the sovereign assisted by a council of eight members, the heads of the departments of the Interior, of Finance, of War, of Foreign Affairs, of Justice, of Agriculture, Commerce and Public Works and of Public Instruction and Worship. For purposes of local government Wallachia is divided into 17, Moldavia into 13 and Dobruja into two departments, each administered by a prefect, a receiver of taxes and a civil tribunal. Judges are removable at the pleasure of the superior authorities. The legal codes are founded on the civil law and customs of the two provinces; but though several reforms have been effected in the system of jurisprudence much yet remains to be done, especially in the administration of the law, which is said to be very unsatisfactory and corrupt. The budget estimates for 1916-17 were each \$129,143,860 for revenue and expenditure. The public debt in 1915 amounted to \$368,077,000.

Army and Navy.—The military forces of Rumania are divided into five classes: (1) the permanent army, with its reserve; (2) the territorial army, with its reserve; (3) the militia; (4) the civic guard; and (5) levies *en masse*. Every male inhabitant, from the age of 21 to 46, must serve three years in the permanent army in active service and five years in its reserve,

or five years in the territorial infantry and three years in its reserve. The active service in the cavalry of the territorial army lasts four years, and is followed by four years in its reserve. Whether a young man enters the permanent or the territorial army is determined by lot. Those who for some sufficient reason have not been subjected to the conscription form part of the militia, and those who have finished their term in the permanent or the territorial army also enter the militia till the age of 36. After this age, in the country they enter the levies *en masse*; in the towns, the civic guard. The peace establishment of the Rumanian army in 1914 was 5,749 officers, 124,389 men, 28,585 horses, 808 guns and 570 machine guns. The force mobilized in connection with the war 1914-1918 amounted to a total of 600,000. The effective force of the civic guard and the levy *en masse* is not definitely fixed; but altogether Rumania can put into the field about 290,000 men. The navy is insignificant, there being only one armored cruiser of any consequence.

Ethnology and Population.—The Rumanians claim to be the descendants of a colony of Romans located here by the Emperor Trajan, and call themselves *Armâni* or *Romeni*; hence Rumania, which is now universally adopted by the natives as the name of the united principalities. This view, however, has been seriously questioned by ethnologists of repute and may be reasonably doubted on historical and linguistic grounds. By them the evident Latinity of the language is considered of later origin. The race is certainly a mixed one, being modified by Greek, Gothic, Slavic and Turkish elements. This mixture makes itself apparent in their language; among words in common use are *apa* (Lat. *aqua*), water; *pane* (Lat. *panis*), bread; *alby* (Lat. *albus*), white; *negru* (Lat. *niger*), black; and so on. The conjugations also of the verbs, which are four in number, correspond exactly to the four conjugations in Latin. For a long time Greek was the language spoken by the court and the upper classes; but latterly this language has been largely superseded by French. The population of Rumania, according to the latest census, numbered 7,500,000. The Rumanians are in general strong and stoutly built, with black hair, brilliant eyes and a complexion similar to that of the Italians. Besides the Rumanians proper there are about 400,000 Jews, 300,000 Gypsies, 95,000 Slavs, besides Germans, Magyars, Greeks, etc. There are also large numbers of Rumanians inhabiting Hungary, Transylvania, Bessarabia, etc.

Sociology.—Since the introduction of railways great changes have taken place in the condition of the people. The peasants were never, properly speaking, serfs, but being compelled to work gratis for the proprietor a certain number of days every year they became fixed to that part of the country in which they were born. They are now, however, not only perfectly free, but each head of a family received during the late Prince Couza's reign a small portion of land, of which he became absolute proprietor, the landlord having been compensated by bonds bearing 10 per cent interest. Their dwellings are generally of a wretched description. Many of the towns are merely agglomerations of large houses, the residences of the boyards, surrounded by the huts of their dependents. The

streets are illy paved, or, most generally, not paved at all, and are usually filthy; the roads, of which there are too few, are in most cases in a wretched state. Agricultural labor, the chief employment of the inhabitants, is cheap, as most of the laborers are so poor that they engage for work to be done three years afterward, in order to obtain advances of money. More than three-fourths of the population are peasants. Handcraftsmen are comparatively few, as the peasant usually builds his own house and makes his own furniture and utensils. In Moldavia there are about 3,000 boyards, besides an extensive lower nobility; in Wallachia they are still more numerous, every twenty-eighth man being a nobleman. There is no native middle class, and the higher ranks of society have only the law open to them as a profession. The commerce of the country is in the hands of the Jews and foreigners. The staple food of the inhabitants is maize; the common beverage is wine, which is produced in great quantities though mostly of inferior quality. This, however, is owing altogether to the manner in which it is made, and, as already stated, some good wine is also produced. The common people are good-humored, sober and cleanly, and murder and robbery are almost unknown.

Religion and Education.—The established religion is that of the Greek Church, to which about 97 per cent of the population belongs. At the head of the clergy are the metropolitan archbishops of Moldavia and Wallachia, the latter of whom is primate of Rumania. Each bishop is assisted by a council of clergy and has a seminary for priests. In 1863 the national finances were so low that the government was compelled to appropriate the estates of the monasteries, whose revenues amounted to about a third of that of the state, allowing in return a sum of about £700,000 for the support of the religious communities. It was determined that the balance should be devoted to the support of schools, hospitals, the relief of the poor, etc. Rumania possesses 5,000 elementary schools, 57 high schools, 8 normal schools and 2 universities, besides other special schools. Education is compulsory, but is still very backward.

History.—Rumania formed an important part of the Dacian territory which was conquered by Trajan and formed into a Roman province in 106 A.D. It became the battle-field of the Goths, Huns, Bulgarians, Magyars and Poles, who in succession held possession of the country for a more or less lengthy period. All these races left some traces among the Romanized Dacian inhabitants, thus helping to form that mixed people who in the 11th century were converted to the Christianity of the Greek Church. About that epoch the Kumans, a Turkish tribe, established in Moldavia an independent kingdom. Two centuries later it fell into the hands of the Nogai Tatars, who so desolated the country that only in the mountains and forests was left any trace of the native population. Toward the end of the 13th century Radu Negru of Fogarash, a petty Transylvanian chief, took possession of part of Wallachia, divided it among his boyards, founded a Senate of 12 members and an elective monarchy, and in the course of time conquered the whole province. About the middle of the following century Bogdan, a Hungarian chief,

made a successful attempt to repeople Moldavia. Struggles for the ruling power, civil and foreign wars occurred. In 1418 Wallachia was conquered by Mahomet I, son of Bajazet. Likewise in 1529 Bogdan, son of Prince Etienne, submitted Moldavia to the Porte. After the conquest of Central Hungary by the Turks, Transylvania became a principality under native Magyar princes, owing the allegiance of the Hungarian Crown, but paying tribute to the sultan as their suzerain. Thus the Rumanians in the beginning of the 16th century were induced to place themselves under the protection of the Sublime Porte, and the boyards were gradually deprived of their power to elect their own ruler, whose office was bought and sold at Constantinople. Voyvodes or dukes of various nationalities were now successively appointed, but their rule proved inefficient in establishing peace and subjection to the sultan, as the boyards never lost an opportunity of making known their dissatisfaction. One of the most distinguished foreigners was Basil Lupulo, a Greek of Epirus, who promoted civilization and learning, but was deposed in the middle of the 17th century. For a brief period at the close of the 16th century the Wallach, or Ruman, nationality was brought under the sway of a single monarch, Michael the Brave of Wallachia, who brought Moldavia and Transylvania under his sceptre. From 1732 to 1822 the country was again governed, or rather misgoverned, by Fanariot (the name comes from the section of Constantinople occupied by Greeks) princes, who merely farmed out the revenues, enriching themselves and impoverishing the land. A considerable number of the boyards, through intermarriage with the Fanariots, were more than half Greek by descent; the court language was Greek, and the religious and political sympathies of the country lay in the same direction. In 1802 Russia succeeded in establishing a sort of protectorate over the principalities, and in 1821 a desperate struggle to throw off entirely the Turkish authority almost desolated the land. In 1822 the sultan was compelled by Russia to select the princes of the provinces from natives, and seven years later to allow them to retain their office for life. In 1853 Russia took military possession of the provinces, but was compelled in a short time to retire, Turkey having received the assistance of France and England. Meanwhile, in 1848, the Hungarian Diet disposed of Transylvania by voting its formal annexation to Hungary. In the Treaty of Paris at the close of the Crimean War in 1856 it was agreed, among other things, that the principalities of Moldavia and Wallachia should continue to enjoy, under the suzerainty of the Porte and under the guarantee of the contracting powers, the privileges and immunities of which they were in possession; and that no exclusive protection should be exercised over them by any of the guaranteeing powers. The Porte engaged to preserve to the principalities an independent and national administration. In 1858 the principalities were united under one ruler, Colonel Couza, who took the title of Prince Alexander John I. In 1861 Moldavia and Wallachia were formally brought under one administration. A revolution which broke out at Bucharest in February 1866 forced Prince Alexander to abdicate, after which the repre-

sentatives of the people elected as ruler Charles, son of the late Prince Charles of Hohenzollern-Sigmaringen. In the Russo-Turkish War of 1877-78 the principality sided with Russia, but in spite of the important services which it rendered in that war, it was compelled at the close to retrocede the portion of Bessarabia which it had acquired at the conclusion of the Crimean War, and to receive in exchange the Dobrudja. Early in the war the principality proclaimed its independence of Turkey, and its independence was recognized in the Treaty of Berlin, July 1878. As already stated, it became a kingdom in 1881, Prince Charles becoming king as Charles I. His wife was well known as a writer under the pseudonym Carmen Sylva. His nephew and heir, Prince Ferdinand, was married in 1893 to Princess Marie, daughter of the late Duke of Saxe-Coburg-Gotha.

The policy of modern Rumania was dominated by the German plan of expansion toward the East. King Charles, being a Hohenzollern, retained feelings of closest intimacy with the Austrian emperor, Franz Joseph. But as early as 1907 forces within Rumania had begun to turn her away from Austria and set her toward France. In that year a very serious outbreak had taken place among the peasants which resulted in much needed agrarian reforms. Moreover, dissatisfaction had been growing with the governments at Vienna and Budapest. The Magyars had been more than ever annoying the Rumanians of Transylvania, and Austria was discriminating against Rumanian commerce. At the beginning of the Balkan War (1912) Rumania was an interested onlooker of the struggle which the other Balkan states were waging against Turkey, but she joined Serbia and Greece in the second Balkan War against Bulgaria. As a result Rumania got the Dobrudja region north and east of a line drawn from Turtukai to Baltchik. Fear of Bulgarian revenge caused Rumania, Serbia and Greece to draw more closely together, and Rumania was now recognized as the leading Balkan power according to the Treaty of Bucharest (10 Aug. 1913). On 10 Oct. 1914 King Charles died and was succeeded by the Crown Prince, Ferdinand. In the first year of the Great War Rumania had announced a policy of strict neutrality. Although she maintained her neutral attitude during the Teutonic drive into the Balkans (1915), she was drawn into the conflict the following year, only to collapse in the fall of 1916, upholding the claims of the Rumanians of Transylvania. After the outbreak of the Russian Revolution (15 March 1917) and the subsequent Brest-Litovsk Treaty (3 March 1918), Rumania was forced to come to terms with Germany. The only alternative left to the country if the conditions were refused was to submit to seizure by the Central Powers. Under the peace treaty (6 May 1918) Rumania was compelled to give back to Bulgaria that part of Dubruja which had passed to Rumania by the Treaty of Bucharest of 1913. The northern section of Dobrudja, which includes the mouth of the Danube and Rumania's only outlet to the Black Sea, was ceded to the Central Powers, to administer through a mixed commission. In addition wheat, salt and petroleum concessions were made to Germany; and Austria-Hungary profited by the "rectification" of the Transylvanian frontier, to the ex-

tent of gaining important mountain passes and valuable mineral lands. As for Bessarabia, Austria had declared, during negotiations, that Rumania would be compensated for loss of the Transylvanian boundary territory by taking the southern part of Bessarabia. This latter country, one of the richest farm lands of what was formerly Russia had been so badly ravaged by Bolshevik troops that the Rumanians had been called upon for help by the Bessarabians. As a result the whole of Bessarabia voted (9 April 1918) almost unanimously for union with Rumania.

RUMANIAN LANGUAGE. The origin of the Rumanian language dates from the 2d century, when the Roman colonies settled themselves on the left bank of the lower Danube. By its grammar and vocabulary this language belongs to the group of the Romance languages, and it is spoken to-day by the vast majority of Rumanians over the whole of Rumania, in Transylvania, Bessarabia, Bukovina and the Dobruja.

Antonio Bonfinius (1427-1502), the learned Latin historian of the Renaissance, was the first to introduce scientific research of the origin of the Rumanians as a people. He enunciated the theory of their Roman descent, regarding them as descendants of the Dacian colonists of Trajan, who spoke a particular Latin dialect, *lingua rustica*. Bonfinius' contention was passed on from historian to historian until by the 19th century it had been credited in very wide circles. In the year 1812 a history of the Rumanians written by a Transylvanian priest, Peter Major, appeared and aided in establishing the belief in the direct Roman paternity. According to Major, Rumanian is the tongue of Rome transplanted from Italy to Transylvania. It was held that the nationality and language of the Eternal

City continued to survive on Transylvanian soil even after the disappearance of Dacia as a colony. Other Rumanian writers, Cogălniceanu, Laurianu, Xenopol and Maniu, confirmed the theory of unbroken continuity (*continuitate neîntreruptă*) between the Legions of Trajan and the present-day Rumanian peasantry. These historians grouped into a homogeneous mass the Dacian colonists and other tribes, and considered them as one until the invasion of the Hungarians annihilated their institutions and laws. Not only did the Rumanian historians maintain this view, but even European scholars such as Gibbon, Thierry, Mommsen and Ranke, also exploited these ideas. Over against this array of scientists there is another group of philologists who stood for a different conception of the origin and development of the Rumanian language. They assail the assertion of the unbroken continuity of the Rumanian language as exaggerated. The men who form this group are: Sulzer, Kopitar, Miklosich, Goos, Roesler, Paul Hunfalvy and Tomaschek. These skeptics base their position upon the evidence offered by the structure of the language and consider old Illyricum (the western part of the Balkan peninsula) as the cradle of the Rumanian language. They assume that Rumanian spread from the Adriatic to the north-east about the time of the Middle Ages, and that through reaching Slavic culture it became enriched and strengthened. It seems reasonable to suppose that the language which was founded by the early colonists was in form and content Roman and that on account of modification by the tongues of the early inhabitants of the colonized region, it gradually became the true Rumanian language. The Latinization of the Albanian tongue is due to the Roman occupation. And both of these, the Rumanian and the Albanian, possess no greater number of words from the Age of Augustus than do the Latin languages of the West, but they manifest the Roman elements in a somewhat more ancient form than do Italian and French. The guttural sounds are never, at least in the root, rendered into palatals or sibilants, while the sibilant *s* has often retained in Rumanian, as in Spanish, its original tone even when placed between two vowels: Rumanian, *cesar*, Latin, *cæsar*; Rumanian, *rosei* from *rod*; Latin, *redo*, *rosi*. It is noteworthy that where Latin words have survived they are sometimes purer than in the Romance languages of the West; for instance, Latin *domina* is better represented by Rumanian *doamnă* (lady), than by Italian *donna*, Spanish-Portuguese, *dona* and French, *dame*. Some words such as *laudare*, to praise, *ducere*, to lead, *credere*, to believe, retain some forms unaltered under which they were used by Virgil and Cicero.

The Rumanian dialects have an article, just as Italian, *il uomo*, *i uomi*, but while in Italian it precedes the word, in Rumanian it is appended to the word, *omu-l*, *oameni-i*, a characteristic which Albanian shares. The article is the same but it is adapted to the spirit of the Rumanian and Albanian. Such is the case with certain numerical words. The numbers, 11, 12, etc., are expressed in Italian *undici*, *dodici* . . . , while the Rumanians employ an assisting word *spre* (supra); *un-spre-sece*, *doi-spre-sece*, etc. The same construction is found

in the Albanian, *spre* corresponding to *mbe* in the latter (*nië-mbe-diëtë, dhi-mbe-diëtë*). Making ordinals with the help of articles is similar in Rumanian and Albanian; and the comparison of the adjective runs parallel in the two languages. Rumanian has no special infinitive, but it has to be constructed by a descriptive form (*to see*, will thus be expressed by the combination of *that I see*); the same holds true of Albanian. The lack of infinitives is sometimes to be noted in Serbo-Croatian: *Ja ću još jednu godinu da te slušim* (V. Karadžić, Pripov. 51). But both forms are to be found in Rumanian as well as Serbian. The influence of Serbian and other South Slavic tongues upon Rumanian became more pronounced as Latin-Italian waned. When the Roman source evaporated, the impress of Slavic culture became marked. During the course of the 9th and 10th centuries Old Slavic was the church language of the Rumans. This explains how three-fifths of the words are Slavic, while only two-fifths are of Latin and other origin. The first archives, which mention the Rumans, date from 1210-30. Rumanian words are to be found in Slavic documents since 1436, the first being translations of pseudo-evangelists (1550) and psalms (1577). During the 15th century the Rumans had welded themselves into a compact nation, according to the opinion of Bonfinius. The Church continued Slavic for a longer time, but after 1643 the Rumanian language was employed instead of Slavic for the use of the Orthodox Church. The written word in Rumanian appeared first in Transylvania, as the Latin alphabet came gradually to replace the Cyrillic. Rumanian orthography remained in a transitional state throughout the 19th century, retaining until to-day the Latin alphabet with some special diacritical signs to represent sounds borrowed mostly from the Slavic.

VOL. 23 — 49

RUMANIAN LITERATURE. To get a clear idea of Rumanian (or properly Daco-Rumanian) literature, it will be convenient to divide it into oral and written. The first of these sections includes the interesting *doine* (lyric songs), *balade* (epic songs), *hore* (dance songs), *colinde* (carols), *basme* (fairy tales), *snoave* (anecdotes), *vorbe* (proverbs) and *ghicitoare* (riddles). This literature belongs generally to the cycle of the Balkan nations as a whole, for in everyone of these countries exact parallels are to be found. There was no direct borrowing by one nation from the other, but all of them seem to have stood for a long time under identical psychological influences and to have developed on similar lines. Their folklore shows much family likeness. The heroes are often the same. The Serbs, Bulgars and Rumans sing the chivalrous deeds of their *hajduks* (braves), Starina (Baba) Novak and Kraljevich Marko; or they recite the legend of the Monastery of Argesh or the ballad of Iorgovan, found also in the Russian *byliny*. The Rumanian folk-songs are mostly heard amongst gatherings of peasants, men and women, who transmit them by oral tradition. They are in general unrhymed, rhythmical improvisations, sung to a monotonous chant, accompanied often with a *cobza* (guitar) or with *fluer* (flute), beginning and ending with a refrain. Most of the poems have the wild melancholy and the fierce simplicity of all true popular songs. The epic poetry is not so rich as that of the Serbian, but compares favorably with the Bulgarian. The noted and far-famed *doine* have an undertone of ghastly mystery that reminds one of the Highland "second-sight" and Irish fairy tales. They belong to a world of hanshees and wraiths; there are bits and refrains that recall the *Pharmaceutria* of Theocritus. One striking fact in these poems is the absence of any suggestion of Christianity as a religion, of church, of creed, or ritual of any kind. If there are any religious ideas at all, they are Pantheistic, but with the Pantheism of oceanic islanders. This absence of Christian ideas suggests that the basis of the *doine* may belong to pre-Christian ages; and possibly, may have been colored and influenced by *trigani* (gypsies) and *lăutari*, a kind of wandering minstrels, by whom they are chanted and recited.

For a long time the collection of Rumanian oral literature was neglected, and it began only in the middle of the 19th century. One of the first to collect these treasures of national literature was Vasile Alecsandri in 1852-66. Bringing together the fragments of the Rumanian Iliade, Alecsandri was not so strict as modern study of folklore demands; however, he retained their poetical beauty unerringly. In 1859 A. M. Marienescu collected the songs of Transylvania, S. F. Marian, those of the Bukovina (1873) and T. T. Burada, those of the Dobrudja (1880). But the most complete collections are those of S. F. Marian, *Poesii populare române, I. Balade, II. Doine și Hore* (1873) and G. D. Teodorescu, *Poesii populare române* (1885). The collection of fairy tales started later than that of the ballads. The most important, considered as classical, are the successive publications of P. Ispirescu. The collected tales of the Moldavian Ion Creanga (1837-89) appeared in his *Opere complete*

(1908). Good collections are those of D. Stănescu, *Basme* (1885-93) and *Frâncu și Căndrea* (1888). In the second half of the 19th century Rumanian folklore was published in the reviews of *Convorbiri literare*, and *Contemporanul*. In recent times the only review devoted to the study of folklore is the *Școala de Științe* founded in 1892.

Leaving the popular and oral literature, we come to what has been committed to writing. The earliest specimen of Daco-Rumanian monuments do not go back of the 16th century. All conserved documents prior to this period were written in old Slavonic, which was used by high officials and in church also. Unity of language did not exist at that time. In Moldavia they employed the Russo-Ruthenian dialect and in Wallachia Serbo-Bulgarian. The first and most prominent writer was the Metropolitan Grigorie Tamblacu (Slavic, Grigoriy Tsamblak) who wrote 26 works in three different dialects: Serbian, Bulgarian and Russian. In 1407 he was hegumen of the Serbian monastery Visoki Dečani, and in 1409 went to Russia. A few years later came to Moldavia where he settled and played a prominent rôle, introducing the Cyrillic alphabet and the Slavonic language in the service books of the Moldavian Church. From the 16th century began to appear books and manuscripts in the Cyrillic alphabet and in both vernaculars, Slavonic and Rumanian. The literature of this period consists mainly of translations from the Bible, homilies and chronicles. There is a gospel composed by Radu Gramaticu, 1574 (now in the British Museum); a printed book by a clergyman, Coresi Diaconul (1560-82); a collection of religious writings of the Priest Grigore din Mahaciu, from Transylvania; *Codex Sturđzanus*; and *Codex Veronetea* (*Codicele Veronetea*). All these documents have more historical and philological than literary value. They are clumsy translations from Slavic and Greek works.

In the 17th and 18th centuries Rumanian literature has more national features, but judging by its content it is the spontaneous continuation of the church literature of the 16th century. In this epoch were published prayer-books, psalms and sermons. Among the church authors of that time was the Wallachian metropolitan, Varlaam, who "hated idleness and loved work." He founded in Bucharest a printing press and invited there men of experience who understood their business. The first book published in this printing-house was "The Key of Understanding" (*Cheia înțeleșului*, Bucurest ani dom 1678) written by the rector of the Theological Academy of Kiev, and prefaced by Varlaam himself. Later on were published several books of the Metropolitan Dositheiu, of which the most significant is the *Pieștile Sfinților* ("Lives of the Saints," 2 vols., Jassy 1683). To this kind of literature belongs the *Mântuirea păcătoșilor*, or "Salvation of Sinners," translated from the Greek by a certain Cozma in 1682, which may be regarded as a storehouse of mediæval exempla; and the "Mirror of Kings," ascribed to Prince Neagoe Basaraba, written originally in Slavonic and translated into Rumanian about 1650. Ioan de Vinți compiled *Scriu de aur*. ("The Golden Treasury," Sasz-Shebesh 1688), from some Hungarian Calvinistic collections of obituary sermons. The brothers Radu and Șerban

Greceanu translated *Mărgăritare* ("The Pearls") an anthology made from the Greek homilies of Saint Chrysostom, Epiphanius, Anastasius and Sinaita.

Of greater interest in Rumanian literature are historical productions. They are short annals, written originally in Slavonic by monks in the monasteries of Moldavia and Wallachia. Some of these annals were written in the 16th century, but most of them have not been preserved. The annalists of the later period were usually the sons of the *boyars* from Moldavia, educated in Polish and Russian universities, such as Gregorie Ureche (1590-1646), who wrote "Dominii țării Moldovei și viața lor," and his contemporary Miron Costin whose writings rank as classical. Costin's best works are "Cartea pentru descălecatul de entiu a țării Moldovii," and "Letopisetul țării Moldovei," including the events from 1594 to 1662. The son of the latter, Nicolae Costin (1660-1712), continued the work of his father, and Jon Neculce (1672-1743) wrote the history of Moldavia from 1662 to 1743, a history in which he was participant himself as an eye-witness. In Wallachia the earlier history was written by Radu Logofatul Greceanul (17th century) and Pitarul Hristache, who wrote, about the end of the 18th century, a chronicle in verses: "Istoria farteilor lui Mavroghene Voda." A Russian historian, Nikolai Statariya, called in Rumania Nicolae Milescu, or the Rumanian Marco Polo, wrote interesting historical sketches describing his travels in China, where he was Ambassador of Russia, and where he died in 1714. The Transylvanian author, George Șincai (1753-1816) founder of the Latinist school in Rumanian literature, spent several years in Rome and published a monumental work *Cronica Rominilor și altor neamuri învecinate* (Jassy 1853). Magyar censors burned and forbade this work in Transylvania because of its patriotic tendency. Another Transylvanian, Petru Maior (1755-1821) wrote books on historical, ecclesiastical and linguistic subjects. Two of his most important works are *Istoria bisericeii Rominilor*, and especially *Istoria pentru începutul Rominilor*.

The beginning of the 19th century was an era of preparation. Two foreign influences manifested themselves, French and Greek, or rather Greek-Phanariote. The national language was ignored and Greek was regarded as classical. Into it were translated the lyric and dramatic poems. Among the higher aristocratic classes Greek and French were exclusively used, especially in the *boyar* families. Every writer of better standing was supposed to be familiar with these languages and their literatures. A third influence came to be added toward 1816-20, that of Transylvania, which brought an exalted and intolerant patriotism, born of contact with Hungary, and animated by the Rumanian cult and the hatred of Hellenism. The rôle of the Transylvanian agents consisted in founding schools and newspapers, while the practical sciences, philosophic conceptions and foreign literatures were subjected to vulgarization. The first men in Rumania who proved that scientific works could be written not only in Slavonic and Greek but in Rumanian as well, were George Lazar (died, 1823) and his disciple Ioan Eliade Radulescu (1802-72). They were followed by Budai-Deleanu, author of many his-

torical and poetical works who wrote the famous comic epic, *'Tsiganada.'* Andrei Muresianu was celebrated for some of his patriotic poems and especially the *'Desteapta-te, Romine'* (*'Arise, Rumanians'*), which became the national anthem of Rumania. Among the writers of this time was also D. Bolintineanu (1819-72) who made his mark with *'The Dying Virgin,'* his *'Legende nationale'* and *'Florile Bosforului'* (*'Flowers of the Bosphorus'*), which latter work described the beauties of Constantinople in very melodious language. He wrote tales which were excellently styled, but later on his art began to deteriorate, till the *Reverie* signaled the decline of his inspiration. Grigorie Alecsandrescu (1812-85), another author of the time, wrote with less facility than Bolintineanu, but with more sincerity. His erotic lyrics are now out of fashion, as are all the lyrics of that day. But his patriotic odes have a grandeur that is remarkable, and his satires a great variety of attractions.

In the period 1860-80 was formed the influential literary society *Junimea* (Youth). Prior to the establishment of this society the art of writing had been carried on in rather an inconsequential manner, i.e., without restraint. Authors had had the liberty to write as they saw fit. There is no doubt that therein protruded a grave danger. It had the effect of organizing factional or separatistic schools, as the Transylvanian, the Wallachian and the Moldavian. At the head of the conflicting forces stood Titu Maiorescu (1839-1917) as the *spiritus rector* of the *Junimea* (Jassy, Moldavia), and B. P. Hasdeu (Bucharest, Wallachia). B. J. Hasdeu (1838-1907), a poet, philosopher, historian and critic, was the editor of *Columna lui Traian*. He was aided by V. Urechia, a prolific writer and able historian, who was editor of *Revista Contemporana*.

In the field of pure literature during the second half of the 19th century were distinguished Al. Macedonski, poet and editor of *Literaturul*; Matilde Cuzler Poni (b. 1853); Veronica Micle (1853-89); T. Serbanescu (b. 1839); A. Sihleanu (1834-57) and especially Mihail Eminescu (1849-89). The latter had a determining effect upon Rumanian literature, and knew how to express the most profound thoughts in a form which gave new life to the Rumanian language. The period in which Eminescu wrote and lived was characterized by the multiplicity of the sources of inspiration and the diversity of the kinds and groups of writers. Personal independence and perfection of form were features of the time, in which strove the conflicting forces of romanticism and popular literature on one side, and modern European literature on the other. C. Dobrogeanu Gherea (b. 1853) showed himself to be a man of great talent who understood the various literary tendencies and foreign influences in his country. He is the critic who gave in theory the correct formula for the reconciliation of the form and the matter, and, in practice, the independence of the personal inspiration of the artist from the milieu. The ideas of Gherea were best represented and explained by J. Nădejde and V. G. Morzum, directors of the *Contemporanul* in Jassy.

However, the most notable name of this era

was that of George Coșbuc (b. 1866), a poet endowed with deep human feeling, with energy and a great love of nature. He spread respect for national tradition which he fused with the most audacious innovations, profoundly Rumanian. He was without equal, a man of enormous activity and facility in composition and suppleness of style. There could also be mentioned between Eminescu and Coșbuc, Nicolae Volenti, Nicolae Beldiceanu (1844-96), and Alecsander Vlahuța (b. 1858). The latter aided in establishing Eminescu's reputation, but the Transylvanian, Coșbuc, almost outshone Eminescu with his poems which were more thoroughly based upon the national ballads of the country. At present the two Transylvanians, Stefan Josif (d. 1913) and Octavian Goga, founder of the review *Luceafărul* (*'The Morning Star'*) and, in Rumania proper, Alecsander Stavoi and H. Lecca, wrote in Coșbuc's way. Josif shows resemblances to Verlaine, and this new style has made that writer the bright young star in the firmament of Rumanian poesy. Hélène Vacaresco and the Countess Mathieu de Noailles, as well as other members of the Rumanian nobility, write in French.

In fiction appear the names of Joan Ereanga (1837-89), Jacov Negruzzi (b. 1842), whose father Constantin Negruzzi (1806-66) was the well-known translator of Pushkin and Victor Hugo, and Joan Slavici (b. 1848), the lyrical story-writer. Other recognized authors of fiction are Duiliu Zamfirescu (b. 1857) with his romance *'Country Life,'* Al. Vlahuța with his social novels which treat of modern Russia, Nicolae Ganea (b. 1840) who translated Dante, and Barbu Stefanescu (b. 1859) whose works, inspired by modern French literature, were published under the pseudonym of Delvrancea. A. Odobescu created the Rumanian historical novel by his *'Mihnea Voda'* (1858) and *'Doemna Kiajna'* (1860). The modern short story was cultivated in Transylvania by Slavici, Jon Russu-Șirianul, Constantin Sandu and Mihail Sadoveanu. Occasionally Sadoveanu and Joan Ciocarlan revived the setting of old Rumania in their stories of the past. In general the writing of romances, just as among the South Slavs and Neo-Greeks, was given little attention. Authors as well as a public were equally absent. The pathological romance of Constantin Mille entitled *'Dinu Milian'* (1880) was a result of the socialist wave; Vlahuța wrote a romance concerning the woes of an idealist entitled *'Dan'*; and Sofia Nădejde and George Adam tried the experiment of divorce stories.

The drama received but meagre treatment. The light pieces on contemporary life written by Alecsandri and Joan Luca Carageale (1853-1902), the Gogol of Rumanian literature, found their opposites in the heavier and more earnest plays of H. Lucca and R. Rosetti, which parodied French themes. Historical dramatic writings, which in the 70's and 80's appeared in great number, again entirely disappeared in the decades following. The modern Rumanian stage was supplied principally from France, just as that country also monopolized the theatre of the other Balkan nations.

Bibliography.—Gaster, *'Literatura populară română'* (1883); Murray, *'Doine, or the National Songs and Legends of Rumania'*

(1854); Vacaresco, 'Rumanian Folk-songs' (1891); Pompiliu, 'Antologie romana' (1887); Adamescu, 'Notiuni de istoria limbii si literaturii rominesti' (1896); Densusianu, 'Istoria limbii si literaturii romine' (1894); Odobescu, 'Literare si istorice' (1887); Nădejde, 'Istoria limbii si literaturii romine' (1887); Rudow, 'Geschichte des rumänischen Schrifttums bis zur Gegenwart' (1892); Alexici, 'Geschichte der rumänischen Litteratur' (1906); Eftimiu, 'Littérature Néo-Roumaine' in the 'Revue' (Paris 1917); Vaschchide, 'Le mouvement littéraire en Roumanie' in the 'Revue des Revues' (Paris 1899); Gaster, 'Chrestomatie roumaine' (1891).

MILIVOY S. STANOYEVICH,
Former Assistant Professor of Slavic Literature in Zaječar College, Serbia.

RUMBOLD, rŭm'bôld, SIR HORACE, 8TH BARONET, English diplomat: b. 2 July 1829; d. 3 Nov. 1913. He entered the diplomatic service in 1849 and was attaché at Turin, Paris, Stuttgart, Vienna and Ragusa successively. He was secretary of the legation in China in 1859, and was transferred to Athens in 1862. In 1868-71 he was secretary of the embassy at Petrograd, and in 1871-72 he was at Constantinople in that capacity. He was appointed Minister to Chili in 1872; was Envoy Extraordinary to Argentina in 1879-81, to Sweden and Norway in 1881-84, to Greece in 1884-88, and to the Netherlands in 1888-96. In 1896-1900 he was Ambassador to Austria. Author of 'The Great Silver River'; 'Recollections of a Diplomatist' (1902); 'Further Recollections' (1903); 'Final Recollections' (1905), etc.

RUMELI HISSAR, the "Citadel of Europe," a village six and one-half miles northeast by north of Constantinople, of which it forms a suburb. The Castle was built in 1452 by Muhammad II out of materials from Christian churches and other buildings demolished for that purpose, and by the forced labor of Greeks, 2,000 of whom were employed as masons and lime-burners alone. The sultan himself supervised the building of the walls. The Greek emperor sent ambassadors to protest against the fortress as an infringement of treaties, to which the sultan replied that the next envoy sent him on a similar errand would be flayed alive. The citadel enabled him to command the straits and to exact toll from all passing vessels. A particular feature of the fortress is that the plan of its walls represents four gigantic Arabic letters—those which form the name Muhammad, MHMD.

The Castle served as a prison for Christian captives after the capture of Constantinople; among the first incarcerated were Knights of Malta. Nearby is the spot where Darius and his army crossed to Europe over the pontoon bridge constructed by the Samian Mandrocles. Here also the Goths and crusaders crossed into Asia.

RUMELIA, roo-mě'ti-a, Eastern Bulgaria. a province established, with administrative autonomy, by the treaty of Berlin, 1878, known also as southern Bulgaria. It was formerly part of Turkey in Europe. It is bounded on the north by the Balkan Mountains, on the east by the Black Sea, on the south by a line beginning at Cape Seityn about lat. 42° 20' N., and pro-

ceeding west-southwest to the Rhodope Mountains, and on the west by the watershed between the Maritza and the Karasu. Originally it was arranged that the province was to be under the direct political and military authority of the sultan, but to be administered by a Christian governor-general appointed for five years by the Porte, subject to the approval of the European powers. This arrangement continued for a few years, but in 1885 the government was overturned by a popular movement and a union with Bulgaria effected, in which the Porte acquiesced. The capital is Philippopolis. The area is 13,700 square miles. Pop. about 1,200,000. See BULGARIA.

RUMFORD, Benjamin Thompson, COUNT. See THOMPSON, BENJAMIN, COUNT RUMFORD.

RUMFORD, Me., town of Oxford County, on the Androscoggin river and on the Maine Central Railroad, 57 miles north of Lewiston. Rumford Falls, "New England's Niagara," has been utilized for one of the greatest power plants in the East, including a hydroelectric station completed 1918, developing a capacity of 30,000 horse power. At the headwaters of the Androscoggin River seasonal storage is afforded by a system of six lakes, the Rangeley chain, for which it forms the outlet. Each of these has been improved by regulating dams, raising the natural level four feet in one case, 12 feet in another, 20 feet in three of them and 45 feet in one, creating an available storage capacity of 30,000,000,000 cubic feet, with a surface area of 125 square miles. At Rumford a series of three rapids cover a distance of one mile with a total drop of 180 feet. The fall over the first group is 100 feet and is that developed in the hydroelectric plant. It is obtained with the aid of a dam 40 feet high at the head of the rapids, a solid concrete structure 250 feet long. The fall of the second group of rapids is 50 feet. The remaining 35-foot drop is developed mechanically in the mill of a paper company, which, in addition, buys electrical energy from the Rumford Falls Power Company. The smaller rapids are developed by a system of canals, one flowing into the other. In conjunction with the dam at the first group of rapids there is a canal 100 feet wide and 15 feet deep, blasted out of the solid ledge, which carries the water to a gatehouse, thence through tunnels, bored 16 feet in diameter through solid rock and lined with concrete, to the water wheels in the power station on the bank of the river.

The chief industries are paper, paper bags and supplemental chemical works. Since 1900 a notable undertaking has been the building of commodious houses that could be rented at reasonable rates to workers in the several industries; a mechanics' institute and a Carnegie library are the prominent municipal institutions. Pollucite, a geological rarity, occurs with beryl in pegmatite veins in the rocks at Rumford. Pop. about 10,000.

RUMINANTS, herbivorous split-hoofed animals, characterized especially by chewing the cud; they include the camels and llamas, giraffes, deer, pronghorns, antelopes, sheep, goats and ox-tribe and thus nearly all the mammals most economically important to man. All these, except the camels and giraffes, are

represented on the continent of North America, and two—the pronghorns and musk ox—are peculiar to it. In most, no incisor or canine teeth exist in the upper jaw, the place of these being supplied by a hardened or callous pad of gum, against which the lower incisors bite. Six incisors exist in the lower jaw. Canines are always present there, and are usually inclined forward and toward the incisors, which they nearly resemble in form. The general number of lower canine teeth is two. The molar and premolar teeth number six on each side of each jaw and are selenodont, that is possess flattened crowns topped by two double folds of enamel of an irregular crescentic shape. The stomach is divided into four compartments. (See DIGESTION). In feeding, the herbage is rapidly cropped off by the lower incisors pressing against the hardened gum of the upper jaw. The food mixed with saliva is swallowed into the paunch, where it is simply moistened and then passes into the reticulum or second compartment. The aperture of the gullet now closes, and the mass of food contained therein is propelled upward into the mouth by a muscular action similar to that of vomiting. Mastication of the food is then effected by a kind of rotary motion, the lower jaw thus giving a first stroke, for example, from left to right, and the rotary motion continuing persistently afterward from right to left, or in the opposite direction to the first movement of the jaws. This is "chewing the cud." In the camels the motion of the jaws is said to be simply one from side to side. After it has been thus thoroughly masticated and remixed with saliva, the food is again swallowed, and passes on at once into the third stomach and is assimilated.

Two distinct divisions of the ruminants may be recognized according to the nature of the horns, and are known respectively as the "solid-horned" and the "hollow-horned."

The first section includes the giraffe (although no external antlers arise), the deer and pronghorns; and the other the antelopes and the sheep, goat and ox tribes. The antlers of deer consist of nearly homogeneous bony tissue, lighter and more porous in structure than ordinary bone; they are generally much branched or forked, and are shed and renewed every year. (See ANTLERS; DEER).

The horns of the hollow-horned ruminants are entirely different from the antlers of deer, in structure as well as in manner of growth. They are usually common to both sexes, as in our domestic cattle, are simple and not branched and grow continuously throughout the life of the animal, though very slowly after it has reached maturity, and are never shed. They consist of a bony core—an elongated process from the frontal bone—covered with a sheath of horn. (See HORN).

Technically speaking, the ruminant game animals of North America consist of three distinct families, two of which are represented by several genera, and some of the genera by numerous species. These families are the pronghorns (*Antilocapridæ*); the deer (*Cervidæ*); and the sheep, goat and ox tribes (*Bovidæ*). They are all "game animals," and some of them are rapidly approaching extermination. The pronghorn, though usually called the American antelope, is not a true antelope, but is of a distinct family type, found only in North America, and peculiar in the fact that its horns are

branched, and shed annually. (See PRONGHORN). The deer tribe in America consists of five genera, namely, the wapiti (*Cervus*); the small deer of the United States and Mexico (*Dama*, or *Odocoileus*); a Central American brocket (*Masama*); the moose (*Alces*), and the caribou (*Rangifer*). These are separately described under their names. Altogether between 25 and 30 species of deer exist in North America, including Mexico. Of the ox and sheep tribes or horned ruminants, the most prominent native member is the almost extinct bison (q.v.). The mountain sheep (see BIG-HORN) number five species, and the Rocky Mountain goat (q.v.) number two species; but of most of these species so few examples are known and their range is so limited that it may well be doubted whether they will ultimately be regarded as distinct. The goats and sheep are mountain dwellers, their favorite haunts are the more inaccessible parts of the higher ranges and they are exceedingly watchful and sagacious. They have been exterminated in the more accessible parts of their ranges and survive in comparatively small numbers and greatly restricted areas. The musk-oxen, or musk-sheep, are a very distinct type, entitled to a distinctive name free from the implication of such alliance; but the term musk-ox (q.v.) is not likely soon to be displaced. There are two species, the barren-ground and the Greenland.

The ancestors of the higher ruminants are mainly of Old World origin, and are comparatively scarce and late in appearance in the fossil beds of our own continent. The oldest forms definitely known were those of the family *Anthracotheriidae*, pig-like animals, with teeth approaching the selenodont shape and a complete dentition; all the bones of the five-toed feet were free. The type-genus *Anthracotherium* (q.v.) begins in the Oligocene and continues down to the Pliocene, and is known from all parts of the world. Another early group was more sheep-like in its characteristics and forms, the family *Cænotheriidae*, represented by *Cænotherium*, which flourished in the Eocene and Miocene eras. They were small-sized, more delicate than modern sheep, the dentition was complete and four toes reached the ground. Another large group was the family *Oreodontidae*, which was limited to North America, and whose remains have been found plentifully and usually in excellent condition in the Tertiary rocks of the eastern Rocky Mountain region. The oreodonts were ancestors of deer and antelopes and some were horned, while all had five functional toes in front and four behind. Prominent genera are *Oreodon*, of the size of a small pig; *Mesoreodon*, larger and stouter; *Casoryx*, *Agriochærus* and most primitive of all *Protoreodon*. Another primitive family wholly European was *Anoplotheriidae*, represented by the long-known *Anoplotherium*.

RUMP PARLIAMENT, in English history a name by which the remnant of the Long Parliament was known after the expulsion of the majority of its members by the army of Cromwell, 6 Dec. 1648, until the latter's reconvention after Cromwell's death. It having been decided by a majority of the House of Commons that the concessions made to Charles I in the Treaty of Newport were a ground of settlement, Oliver Cromwell, who wished for the condemnation of the king, despatched two regi-

ments under the command of Colonel Pride to coerce the House. In discharge of the resolution of the army that "none might be permitted to pass into the House but such as continued faithful to the public interests," Colonel Pride, whose regiment was stationed so as to block all the entrances to the House of Commons, furnished himself with a list of the names of the members against whom the sentence of exclusion was passed, and as each approached prohibited him from entering. Forty-one members were placed under temporary restraint and 160 ordered to their homes. Only 60 were admitted, all violent Independents, and these constituted the "rump" after the clearance wrought by "Pride's Purge," as it is called. This assembly, in conjunction with the army, brought about the arraignment, trial and condemnation of Charles I. It was forcibly dissolved by Cromwell, 20 April 1653, for presuming to make a stand against certain demands of the army. Twice after this it was reinstated, but both times only for a brief period. In the latter instance, 21 Feb. 1660, the expelled members were restored, it was again known as the Long Parliament and on 16 March 1660, solemnly decreed its own dissolution.

RUMSEY, rŭm'si, James, American inventor: b. Bohemia Manor, Cecil County, Md., 1743; d. London, England, 23 Dec. 1792. He was a mechanical engineer, and while engaged as the superintendent of a mill in Shepherdstown, Va., conceived plans for the application of steam to marine propulsion. In 1786, 21 years before Fulton constructed the *Clermont*, he exhibited a boat upon the Potomac which was propelled by means of a steam pump which forced a stream of water from the stern. The Rumsey Society, in which Benjamin Franklin was greatly interested, was established in Philadelphia in 1788, and later an organization of the same name in England, to further his invention, but he died while his experiments were incomplete. He wrote 'A Short Treatise on the Application of Steam' (1788).

RUMSEY, William, American jurist: b. Bath, Steuben County, N. Y., 18 Oct. 1841; d. New York, 16 Jan. 1903. He was educated at Williams College, volunteered for the Union army in April 1861 and was granted his diploma from the college in June. He served through the war, attaining the rank of captain of volunteers in 1863, major in 1864 and brevet lieutenant-colonel in 1865, in which year he was mustered out of service. He was secretary of the United States legation in Japan in 1865-66, and in 1880-1901 served as judge in the seventh judicial district of the Supreme Court. He then resigned and engaged in law practice until his death.

RUNCIMAN, rŭn'si-mən, Alexander, Scottish painter: b. Edinburgh, 1736; d. there, 21 Oct. 1785. He was placed at 14 with some housepainters, who used to adorn the mantelpieces of the houses which they painted with landscapes, of which many a specimen is still preserved in the houses of the Old Town of Edinburgh. He devoted himself entirely to this art, and acquired considerable local fame for his landscapes. In 1766 he visited Italy, where he met Fuseli, whose enthusiastic character matched aptly with his own. He spent five years in Rome, assiduously studying and copying the Italian masters, and in 1771 returned with

powers increased and taste improved. Just at that time he obtained the mastership of the Trustees' Academy, and his subsistence thus secured, he applied his leisure to historical painting. Among his best-known productions may be mentioned 'Macbeth and Banquo,' in a landscape; a 'Friar,' in a landscape; 'Job in Distress'; 'Samson Strangling the Lion'; 'Figure of Hope'; 'Saint Margaret Landing in Scotland'; 'Christ and the Woman of Samaria'; 'Agrippina Landing with the Ashes of Germanicus,' and the paintings in Ossian's Hall at Penicuik. The work last mentioned was his *chef-d'œuvre*. He was remarkable for candor and simplicity of manners and possessed a talent for conversation. Among his associates were Robertson, Hume, Lord Kames and Lord Monboddo.

RUNCIMAN, Walter, English politician: b. South Shields, 19 Nov. 1870. He was educated at Trinity College, Cambridge, and for a time was connected with shipping interests. He was elected to Parliament in 1899; was Parliamentary secretary to the local government board in 1905-07; financial secretary to the treasury in 1907-08; served as president of the board of education in 1908-11, and of the board of agriculture in 1911-14. In 1912-14 he was commissioner of the King's Woods, Forests and Land Revenues, and he was president of the board of trade in 1914-16. He became a privy counselor in 1908.

RUNEBERG, Johan Ludvig, yô'hân lood'-vig roo'në-bërg, Swedish poet: b. Jacobstad, Finland, 5 Feb. 1804; d. Borgå, 6 May 1877. He was educated at Wasa and at the University of Åbo. His first volume (1830) contained a number of lyrics and a long poem, 'Nights of Jealousy.' In 1832 appeared an epic written in hexameters 'Elgskytterne' (the Elk Hunters); in 1833 a second volume of lyrics, and in 1836 the idyl 'Itanna.' In 1837 he taught Latin literature at the university, became lector at the gymnasium of Borgå, where he remained until his death, being advanced to professor in 1844 and rector in 1847. His other works were the idyl 'Julqvällen' (Christmas Eve) and the epic 'Na donchda' (1841); 'Lyrics' (1843); a romantic cycle, 'Kung Fjalar' (King Fjalar, 1844); narrative poems, 'Fänrik Ståls Sägner' (Ensign Stål's Tales, 1848-60); a rhymed comedy 'Kan ej' (Can't 1862); 'Kungarne på Salamis' (The King at Salamis 1863). His collected works were published in 1876 and posthumous works in 1878-79. See ENSIGN STÅL'S TALES.

RUNES, the characters used in writing by the Teutonic tribes of northwestern Europe in early times. Three classes of runes are recognized, Anglo-Saxon, German and Scandinavian, but the differences of form which distinguished them are no wider than the differences between the alphabets employed in very ancient times by various Greek peoples—between the Old Athenian alphabet, for example, and the Old Corinthian, or between the earliest Phœnician and the earliest Hebrew. The name Rune is significant of the use to which this manner of writing was first applied. In Anglo-Saxon *rūn* means secret, and *runa* magician; and the knowledge of runes was confined to a small class—priests or sorcerers. For this reason, upon the introduction of the Christian religion

the use of the runes was condemned as connected with heathenish superstitions. A poet of the 6th century, Venantius Fortunatus, tells of runes being written on tablets or slabs of ash (*fraxineis tabellis*), but there are extant numerous runes inscribed on memorial stones, personal ornaments, rings, coins, etc., which have been found in Denmark, Norway, Sweden, Germany and Iceland, and in Britain within the limits of the ancient kingdoms of Northumbria, Mercia and East Anglia. Some examples of runes have been found in Ireland, France and Rumania. The best British examples are found on a cross in Ruthwell, Dumfriesshire, Scotland, on a pillar in Bancastle in Cumberland, and on the Frank's casket in the British Museum. The system of characters called runes gets the name Futhorc from the first six letters, just as the Greek system is called Alphabet from the names of the first two letters, alpha and beta, A and B, or as we call our alphabet the A B C. The following examples show the agreements and differences between British and Norse runes:

Anglo-Saxon Runes.

Norse Runes.

The origin of the runes is still a matter of uncertainty. While they are obviously an offshoot of the Helleno-Italic family of alphabets, it is not easy to ascertain at what point they branched out from their ancestral stock. While they have usually been regarded as of a purely Latin origin, the alternative theories have been propounded that they were invented upon a Galatian base, by the the Goths soon after their expedition to Asia Minor in 267, and that they are of Eubœan origin, through the contact of the Goths with Greek colonies in the Crimea. All these theories depend on a dating of the runes which is itself dependent on that of the Gothic bible of Ulfilas, in which an alphabet is used containing at least two runic characters. The authenticity of the 4th century date usually assigned to Ulfilas and his bible has been called into question by the investigations of Prof. Leo Wiener of Harvard University, and accordingly he is able to use for the derivation of the runes Greek alphabets much later than those which were formerly accessible for this purpose. He finds the prototype of the runes in the Greek cursive. He has also explained the order of the runes through their relation to the so-called ogams (q.v.) or tree-runes.

Except in Scandinavia, the runes were always a purely inscriptional alphabet. Scandinavian runic manuscripts exist, but are not

older than the 13th century. The Latin alphabet gradually supplanted the runes, though they lingered on in popular use and in calendars until modern times. In England runes are found between the middle of the 6th and the middle of the 10th centuries. Some Celtic runic inscriptions also exist. Consult Olsen, 'Runerne i den oldislandske Literatur' (Christiania 1891); Stephens, G., 'The Old-Northern Runic Monuments of Scandinavia and England' (Copenhagen 1879); Taylor, T., 'Greeks and Goths: a Study on the Runes' (London 1879); Wimmer, F. A., 'Die Runenschrift' (Berlin 1887).

RUNIC CHARACTERS. See **RUNES**.

RUNJEET SINGH, rŭn-jēt', sĭngh. See **RANJIT SINGH**.

RUNKLE, Bertha Brooks (Mrs. LOUIS H. BASH), American novelist: b. Berkeley Heights, N. J. She was educated privately and was married to Colonel Bash, United States Army, 26 Oct. 1904. Author of 'The Helmet of Navarre' (1901); 'The Truth about Tolna' (1906); 'The Scarlet Rider' (1913); 'Straight Down the Crooked Lane' (1915), etc.

RUNKLE, rŭn'kl, John Daniel, American mathematician: b. Root, N. Y., 11 Oct. 1822; d. Southwest Harbor, Me., 8 July 1902. He was graduated from the Lawrence Scientific School at Harvard in 1851, and having been appointed to the staff of the *American Ephemeris and Nautical Almanac* in 1849, continued with it until 1884. He was one of the promoters of the Massachusetts Institute of Technology and held the chair of mathematics there from the time of its foundation until his retirement shortly before his death, with the exception of 1870-78 when he was president. He established the *Mathematical Monthly* in 1859 and edited it until 1861, and published 'New Tables for Determining the Values of the Coefficients in the Perturbative Function of Planetary Motion' (1856); 'Elements of Plane and Solid Geometry' (1888), etc.

RUNNING RECORDS. See **SPORTS**.

RUNNYMEDE, rŭn'i-mēd, England. Five miles east of Windsor, in Surrey, lying along the right bank of the Thames, is the celebrated meadow where the conference was held, 15 June 1215, between John and the English barons, in which the former was compelled to sign Magna Charta and the Charta de Foresta. (See **JOHN**). Runnymede is now divided into several enclosures.

RUNYON, Theodore, American diplomat: b. Somerville, N. J., 25 Oct. 1822; d. Berlin, Germany, 27 Jan. 1896. He was graduated from Yale in 1842, admitted to the bar in 1846, and established a law practice at Newark, N. J. He became city attorney of Newark in 1853, city counselor in 1856 and at the outbreak of the Civil War went to the front as brigadier-general in command of the 1st brigade of New Jersey Volunteers. He arrived at Washington on 6 May, when the threatened invasion by the Confederates had thrown the city into great alarm, and promptly took efficient measures for its defense. After the defeat of the Union army at the first battle of Bull Run when the city was in danger of invasion, he closed all approaches, stationed cannon to avert the expected attack and thereby saved the National capital,

a service for which he received the personal thanks of President Lincoln and his Cabinet. He was honorably mustered out of service in July 1861 and resumed his law practice. In 1863 he was elected mayor of Newark, served as chancellor of New Jersey in 1873-87, and in 1893 was appointed Minister to Germany. He was raised to the rank of Ambassador in that year and remained in office until his death.

RUPEE, roo-pē', in India, the name given a small silver coin. The value of this coin is nominally 50 cents, but owing to the depreciation of silver it has of late years varied between 30 and 40 cents. A rupee equals 16 annas; one-half, one-fourth and one-eighth rupee are also coined in silver. A *lac of rupees* is 100,000, and a *crore* 10,000,000 rupees.

RUPERT, or **ROBERT**, of Bavaria, PRINCE: b. Prague, 18 Dec. 1619; d. London, 29 Nov. 1682. He was the son of Frederick V, elector palatine and titular king of Bohemia, by the Princess Elizabeth of England, daughter of James I; was educated at Leyden and early engaged in military service in the Thirty Years' War. During the Civil War in England he had the command of a corps of cavalry, at the head of which he distinguished himself at the battle of Edgehill in 1642, at Chalgrove Field in 1643, and also at Marston Moor and at Naseby; but his impetuosity and imprudence contributed to the disastrous result of these latter engagements. In 1648 he was made commander of that part of the fleet which still adhered to Charles. Prince Rupert for some time carried on a predatory warfare against the English; but in an engagement with Blake, off the Spanish coast, he was worsted, and his whole squadron destroyed, with the exception of four or five ships, with which he escaped to the West Indies, where he supported himself by capturing English and Spanish merchantmen. Later he joined Charles II at the court of Versailles, where his time was chiefly devoted to scientific studies till the Restoration, when he returned to England. In 1664 he was appointed with Monk, to the command of a fleet against the Dutch, and in the next war with Holland, in 1673 was made admiral of the fleet. Many useful inventions resulted from his studies, among which are the invention of prince's metal, and although the discovery of the method of engraving in mezzotinto is not due to him, as was erroneously supposed, he introduced the art into England. He also introduced the curious glass drops that have been named after him, Prince Rupert's drops. He was likewise one of the founders and the first governor of the Hudson's Bay Company, incorporated in 1670, and a founder of the Royal Society. Rupert's Land (q.v.) was named after him.

RUPERT (RUPPRECHT MARIA LUITPOLD FERDINAND), Crown Prince of Bavaria, son of Louis III: b. Munich, 1869. He was educated at the University of Munich and at the Kriegsakademie. He entered the army, attained rank as lieutenant-general in 1903, and in 1913-14 he was inspector-general of the army. In the European War he commanded the Bavarian Army on the western front. His heir, Prince Leopold, was born in 1901.

RUPERT'S LAND, the former name of an extensive territory in Canada, conferred by

Charles I on Prince Rupert, transferred to the Hudson's Bay Company in 1670, and since 1870 included with the other parts of the Hudson Bay Territories in the Northwest Territories. The title is still retained to distinguish an Episcopalian diocese; the see of the bishop of Rupert's Land is at Winnipeg. See NORTH-WEST TERRITORIES.

RUPIA, a skin disease, characterized by an eruption of small flattened and distinct bullæ surrounded by inflamed areolæ, containing a serous, purulent, sanious or dark bloody fluid, and followed by thick, dark-colored scabs over unhealthy ulcers. Three varieties of this disease are described, *Rupia simplex*, *Rupia prominens*, and *Rupia escharotica*. *Rupia simplex* commonly appears on the legs, sometimes on the loins or thighs, and seldom on other parts. The bullæ are not preceded by any inflammatory symptoms, vary from one-half inch to one inch in diameter, and contain at first a transparent serous fluid, which soon becomes turbid and purulent, and dries into scabs. The scabs are easily removed, displaying an ulcerated surface underneath, and several series of these scabs may follow before healing sets in. In *Rupia prominens* the bullæ are larger, the scabs thicker and the ulceration deeper. The scab adheres firmly, and generally requires emollient applications to facilitate its removal. *Rupia escharotica* occurs chiefly in cachectic children and infants. It is commonly confined to the lower extremities, and begins by one or two red and livid spots, over which the cuticle is soon raised by the effusion underneath it of a serous fluid. The bullæ thus formed increase; the serum they contain becomes turbid, and of a blackish hue. A bloody and offensive sanies marks the surface of the sore, the edges of which are livid, but not very painful. *Rupia* is chronic, not dangerous, not contagious, but often very obstinate. It generally attacks persons debilitated by age, intemperance, bad living or previous diseases, especially smallpox, scarlet-fever and syphilis. The general treatment consists mainly in the administration of tonic decoctions, more especially those of cinchona, cascarilla, gentian, etc., with alkalies, a generous and nutritious diet and warm salt water and alkaline baths. The local treatment consists chiefly of puncturing the bullæ early, and allowing the morbid secretion to escape; of poulticing in order to remove the scabs, and of applying lotions containing nitrate of silver or nitric acid, or any other slightly stimulating application.

RUPP, rūp, Julius Augustus Leopold, German Protestant theologian: b. Königsberg, 13 Aug. 1809; d. there, 11 July 1884. He was educated at Königsberg and was connected with the faculty there from 1830 until 1851, when his religious teachings cost the loss of his position. He was at one time a preacher at the Royal Chapel but was deprived of his benefice because of his broad religious views. Upon his failing to receive royal confirmation after his election as pastor of the German Reformed Church at Königsberg, he in 1846 founded a "free congregation" at Königsberg and was one of the leaders in that movement. Author of 'Der Symbolzwang und die protestantische Gewissens- und Lehrfreiheit' (1843); 'Literarischen Nachlass' (1891-1902), etc.

RUPTURE, hernia (q.v.), especially abdominal hernia, to which the term rupture is most frequently applied in popular usage.

RURAL CREDITS. See **LAND CREDIT**; **FEDERAL FARM LOAN ACT**; also **BANKS AND BANKING**.

RURAL DEPOPULATION. See **FARM AND FARM PROBLEMS**.

RURAL LIBRARIES of the present are largely an outgrowth of the general library movement in the United States for the past 40 years. Nevertheless, many of these libraries are due to earlier educational movements. The desire for self-education which has characterized the United States ever since the colonial period stimulated the growth of societies devoted, like Franklin's Junta, to the improvement of their members. These spread to the small towns throughout the original colonies. The isolation of these small communities, due to wretched transportation facilities, made these societies play a large part in the community life. Libraries were a recognized part of the activities of many of these societies. Even when the society dissolved, the library often persisted to become either the predecessor or the direct ancestor of a modern public library. Many of the libraries of New England, New York and the Atlantic seaboard originated in this way. The lyceum movement, which was influential throughout the North and West from about 1830 till after the Civil War, through its lecture courses and public discussions caused the formation of many society libraries. Even the villages, too small to maintain lecture courses, had their local "literary" or "debating societies." Many of these maintained small libraries for their members. School libraries became fairly common. Many of these like the "school district libraries" of New York State (authorized by law in 1834) served as rural community libraries also. Sunday-schools became very common everywhere. A small library was considered an essential part of nearly all of these, whether urban, village or in isolated church or schoolhouse. These libraries served an excellent purpose in familiarizing the rural sections with the library idea even though their books were usually confined to the mediocre or evangelistic types.

Massachusetts in 1890 established a library commission which took for its purpose the founding of a free public library in every town in the State. Other library commissions were founded. In every case the founding and maintenance of rural libraries was one of their chief duties. Through the traveling libraries maintained by these commissions the number of rural libraries was greatly increased and the number and quality of their books and periodicals materially improved. The commissions have also done excellent work in attempting to put the small rural libraries in touch with larger libraries and other library activities of their respective States.

Coincident with the rise of library commissions, the University Extension movement, which was imported from England in 1887 and flourished in the United States for more than a decade afterward, promoted the formation of "extension centres" and study clubs. The need of library facilities for the use of these groups soon became apparent and, in many cases, led

to the formation of rural libraries free for the use of the entire community. Later educational reading circles and other extension movements of universities or State departments of education, have done much to show the need of rural libraries. Rural community centres also usually have a small library as part of their equipment.

Rural libraries, like rural schools, are probably only at the beginning of their adequate development. In many cases they will, in all probability, be merged with the rural school library. In the larger villages the rural library will probably be independent of the school library, though co-operating with it in every practicable way. Virtually all the State library commissions, many of the State departments of education and the Federal Bureau of Education are increasing their efforts to obtain good library facilities for all residents of the State, whether in the city, the town, the remote hamlet or the isolated farmhouse. The rural school has been made possible only through State supervision and State support. It seems probable that the rural library as well is destined to receive a greater share of State support than it now gets. Closer organization of rural library interests has been begun in some places through district libraries which act as reference and distributing centres for the small libraries of their districts. In many States the county has been adopted as the district unit. The first of these county libraries was the Brumback Library of Van Wert, Ohio, which became the library centre for Van Wert County in 1894. The best-known State system of county libraries is that of California.

Many rural libraries depend almost entirely on voluntary "library associations" or educational and social clubs for their support. In an increasing number of cases the library is aided by the tax funds obtained from State and local sources. The rural libraries entirely supported by funds raised by public taxation are as yet in the minority. This, however, is the only logical means by which library facilities can be supplied adequately to rural districts and State support of libraries must increase with a growing interest in rural education. Trolley lines, better roads and the automobile have made it easier for the smaller towns and villages to act as library centres for the surrounding rural population. Book-wagons with definitely planned routes have been used to supplement the work of the local library (e.g., at Hagerstown, Md., and by the library commissions of Connecticut and Delaware).

Rural libraries are of great educational significance because of their direct contact with the people they serve. The material they circulate becomes a force in the community to an even greater extent than it does in larger places. Numerically, the rural library exceeds any other type. No library movement which does not take into account the rural library can have more than partial success.

The great needs of rural libraries are more money for more and better books and for the payment of salaries which will attract and hold librarians who are not only socially-minded but who have education and book sense enough to get the books most needed for the specific communities the libraries serve.

The State library commissions are aiding the small libraries to get better books, through bulletins, book lists and other publications whose purpose is to advise the library in the selection of suitable books. The Wisconsin Free Library Commission regularly includes in its monthly "Bulletin" a "Selected list of current books." The New York State Library issues an annual 'Best Books for a Small Library.' The *Book-list* of the American Library Association serves a similar purpose for larger libraries. In the matter of salaries, the chief force at present is a growing realization, on the part of rural library boards, of the need of competent librarians. This is aided by a tendency, clearly apparent at present, toward the requirement of definite minimum educational and professional qualifications for all librarians engaged in public libraries of all types.

Bibliography.—The literature of rural libraries is relatively scanty. Valuable material is listed in Cannons, H. G. T., 'Bibliography of Library Economy' (London 1910) and in 'Library Work' (cumulated, Minneapolis 1912). The *Library Journal* and *Public Libraries* contain much material on the subject of rural and other small libraries. The most direct source of information is often the bulletins of the different library commissions, since these are chiefly devoted to the interests of small libraries.

FRANK K. WALTER,

Vice-Director, New York State Library School.

RURAL SCHOOLS. See EDUCATION, ELEMENTARY.

RURAL AND FOLK THEATRES.

"The Little Country Theatre" of North Dakota not only illustrates the wide popularity of theatricals to-day, but also points to the deepening influence of the dramatic arts, almost religious in its intensity. The population of North Dakota is mainly foreign and made up of some 25 different nationalities, thinly scattered. There are 140 towns, each containing less than 500 people; and intellectual companionship and culture were not easily obtainable. Exodus to the big cities was the natural consequence. The solution of the problem of stemming this tide was found in the amateur community theatre for the rural districts. Established with this end in view by Alfred G. Arvold of North Dakota Agricultural College, in 1914 in Fargo, the Little Country Theatre has already succeeded far beyond expectations and spread into every corner of the State. It will serve as a model for many similar experiments already in the bud all over the land. The old dingy chapel on the second floor of the administration building of the Agricultural College was refurnished at slight cost into a theatre. Simplicity on every hand was the guiding principle. The young people did most of the writing, acting, costuming, scene-painting and scene-shifting for themselves. A moving-picture machine was installed. About 2,000 people participated in these home-talent plays; 1,600 pieces of play-matter were loaned in the course of a few months. The audiences were enthusiastic and sometimes aroused into good-humored excitement. North Dakota had solved her agricultural and social problem. One of the most-considered of all rural theatres is that founded and maintained by Maurice Pottecher, poet, dramatist and actor-manager, among the peo-

ple of Bussang, a mountain district of the Vosges in France. In all times, from the far East to the far West, some form of rustic theatre (mainly itinerant) has existed. For the romantic particulars of the old strolling players, consult Mantzius, K., 'History of Theatrical Art in All Ages.' For the recent people's theatre revival in Europe, a movement that has shown most energy in Germany and in Russia, consult Pottecher, Maurice, 'Le Théâtre du peuple de Bussang (Vosges): son origine, son développement et son but exposés par son fondateur' (Paris 1913); Rolland, Romain, 'Le Théâtre du Peuple: Essai d'esthétique d'un théâtre nouveau' (Paris 1904); Kahn, A., 'Le Théâtre social en France' (Paris 1907); Morel, Eugene, 'Projet de théâtres populaires' (in *Revue d'art Dramatique*, Vol. XV, pp. 1115-1188, Paris 1900); Le Braz, Anatole, 'La Résurrection du théâtre populaire en Bretagne' (in *La Grande Revue*, Vol. VII, p. 140, Paris 1898); Van Dooren, J., 'Le Théâtre du peuple' (in the *Revue de Belgique*, Series 2, Vol. XXVII, p. 31, Brussels 1899); Sellers, Edith, 'The People's Theatre in Berlin' (in the *Contemporary Review*, Vol. LXXVII, p. 870, London 1900); Mehring, F., 'Die Freie Volksbühne' (in the *Neue Zeit*, Vol. II, p. 530, Stuttgart 1900); Prod'homme, J. G., 'Le Théâtre populaire en Bavière' (in the *Revue des Revues*, Series 3, Vol. XXXIII, p. 524, Paris 1900); Moderwell, H. K., 'The Theatre of Today' (Boston 1914); Calvi, E., 'Il Teatro popolare romanesco dal Medio Evo ai tempi nostri' (in the *Nuovo Antologia*, Series 5, Vol. CXXXIV, p. 689, Rome 1908); Long, R. E. C., 'People's Theatre in Russia' (in the *Nineteenth Century and After*, Vol. LII, p. 775, London 1902).

K., 'The Medieval Stage' (2 vols., Oxford 1903); Gregory, Lady, 'Our Irish Theatre' (New York 1913); Matthews, Brander, 'Importance of the Folk Theatre' (in 'Aspects of Fiction', 3d ed., New York 1902); Maxwell, Gerald, 'Revival of the Folk Drama' (in the *Nineteenth Century and After*, Vol. LXII, p. 925, London); Merington, Marguerite, 'Village Players: and every community producing its own plays' (in *World's Work*, Vol. XVII, p. 254, London 1911); Ordish, T. F., 'Folk Drama' (in *Folk Lore*, Vol. II, p. 314, and Vol. IV, p. 149, London 1891 and 1893); Ward, A. W., 'History of English Dramatic Literature to the death of Queen Anne' (2d ed., London 1899).

RURIK, roo'rik, founder of the Russian monarchy: d. 879. Most writers consider him to have been a Varangian, of Scandinavian origin, though Kostomorof has endeavored to prove that he was a Lithuanian. It is recorded that he came to Russia about 862, accompanied by his brothers Sinaf and Truvor, in compliance with the request of Gostomisl, a leading personage of Novgorod. One of the brothers established himself at Belozersk, the other at Izhorsk, while Rurik began by fortifying himself in the ancient town of Ladoga, at the present day a miserable village on the Volkhof. The Novgorodians soon repenting, rose in rebellion against Rurik, and at their head was one of their fellow citizens named Vadim, whose valor

is celebrated in the ancient chronicles and in Russian song. Rurik succeeded in establishing a dictatorship in Novgorod in 865 and is said to have killed Vadim with his own hand. His possessions were soon afterward greatly enlarged by the death of his brothers, whose principalities, since they died without issue, Rurik united to Novgorod. In order to secure himself and his descendants in their newly acquired territory, he invited various colonies of Varangians, on whose devotion he could count, to settle in the country. Rurik died after a reign of 17 years. The family of Rurik reigned in Russia until the death in 1598 of Feodor, son of Ivan the Terrible, when it was succeeded by the closely allied house of Romanoff.

RUSBY, Henry Hurd, American botanist and educator: b. Franklin, N. J., 26 April 1855. He was educated at the Westfield (Mass.) State Normal School, the Centenary Collegiate Institute, Hackettstown, N. J., the College of Physicians and Surgeons, New York, and the medical department of New York University; was botanical explorer for the Smithsonian Institution in the southwestern United States 1880-83, and privately in South America 1885-87 and in 1896, and in Mexico at various times since 1900; has been professor of botany and materia medica in the New York College of Pharmacy since 1888 and for many years dean of its faculty; professor of materia medica at Bellevue Medical College and New York University 1897-1902 and of the principles of stock-feeding in the American Veterinary College for many years. He is a member of many learned societies, chairman of the Scientific Directors of the New York Botanical Garden and honorary curator of the Economic Museum; since 1890, member of the committee for revising the United States Pharmacopoeia. His greatest public services have been as a leader in reforming and standardizing pharmaceutical education in the United States and, as pharmacognosist of the United States Department of Agriculture (1912-17), for examining drugs offered for import at New York, since 1907, in purifying our foreign drug supplies, in which work he has been the chief agent. For this service he was elected to membership in the National Institute of Social Sciences. He was instrumental in securing the vindication of Dr. Wiley and his associates from charges in 1911 and in eliminating his detractors from the Department of Agriculture. His publications include 'Essentials of Pharmacognosy' (1895); 'History of the New York College of Pharmacy' (1895); 'Morphology and Histology of Plants' (1899); 'Manual of Botany' (1911); many pamphlets on the flora of South America, including the contribution of hundreds of new species and genera, and one family; botany, materia medica and physiology of the National Pharmaceutical Syllabus; botany and materia medica of the 'National Standard Dispensatory' and of Buck's 'Reference Hand-book of the Medical Sciences,' etc.

RUSCHENBERGER, rüş'en-bërg'er, William Samuel Waithman, American naval surgeon: b. Cumberland County, N. J., 1807; d. Philadelphia, 24 March 1895. He became surgeon's mate in the United States navy in 1826, took his M.D. at the University of Pennsylvania in 1830 and in 1831 re-entered the

navy as surgeon. He was connected with the Naval Hospital at Brooklyn in 1843-47 and while there reorganized the laboratory to secure pure drugs for use in the service. He served with the East Indian, Pacific and Mediterranean squadrons, with intervals of land duty and at his retirement in 1869 he was senior officer of the Medical Corps. He was commissioned medical director on the retired list in 1871. Author of 'Three Years in the Pacific' (1834); 'A Voyage Around the World, 1835-37' (1838); 'Notes During Voyages to Brazil and China' (1848); 'Elements of Natural History' (1850), etc.

RUSH, Benjamin, American physician: b. Byberry, near Philadelphia, Pa., 24 Dec. 1745; d. Philadelphia, 19 April 1813. He was graduated from Princeton in 1760, from the University of Edinburgh in 1768, and became professor of chemistry at the College of Philadelphia in 1769. He was active in the pre-Revolutionary movements and as member of the provincial conference of 1776 moved the resolution declaring the expediency of a declaration of independence, of which he was a signer in the following month. He was surgeon to the Pennsylvania navy in 1775-76 and in 1777 was appointed surgeon-general and later physician-general of the hospitals of the middle section. In 1778 he resigned and resumed his practice and his professorship at Philadelphia. He was a member of the convention which formed the constitution of 1780, established the first dispensary in the United States in 1785 and in 1787 was a member of the convention which ratified the Federal Constitution. He became professor of the theory and practice of medicine in 1789 and after the Medical College was merged in the University of Pennsylvania was appointed professor of the institutes and practice of medicine and of clinical practice. In the yellow fever epidemic of 1793 Rush instituted a new method of treatment for the disease which he used with great success, visiting from 100 to 120 patients daily. He was one of the founders of Dickinson College, an advocate of the abolition of slavery, was connected with various religious and scientific societies and was treasurer of the United States Mint from 1799 until his death. He wrote 'Medical Inquiries and Observations' (5 vols., 1789-98); 'Essays, Literary, Moral and Philosophical' (1798), etc.

RUSH, Richard, American diplomat: b. Philadelphia, 29 Aug. 1780; d. there, 3 July 1859. He was graduated from Princeton in 1797, was admitted to the bar in 1800 and engaged in practice at Philadelphia. In 1811 he was appointed attorney-general of Pennsylvania and in 1814-17 was attorney-general of the United States. He was temporary Secretary of state under President Monroe in 1817 and was then appointed Minister to England, a post he occupied until 1825 when he was recalled to become Secretary of the Treasury under President Adams. He was a candidate for the vice-presidency on the ticket with Adams in 1828 and in 1836 was appointed by President Jackson commissioner to obtain the legacy for the founding of the Smithsonian Institution which was then pending in the English Chancery Court, returning in 1838 with the entire amount. He was appointed Minister to France in 1847

and remained such until 1851 when he was recalled at his own request and spent the remainder of his life in retirement. He published 'Codification of the Laws of the United States' (5 vols., 1815); 'Narrative of a Residence at the Court of London from 1817 to 1825' (1833); 'Washington in Domestic Life' (1857); 'Occasional Productions, Political, Diplomatic and Miscellaneous, Including a Glance at the Court and Government of Louis Philippe and the French Revolution of 1848' (published by his sons, 1860).

RUSH, William, American sculptor: b. Philadelphia, 4 July 1756; d. there, 17 Jan. 1833. He was apprenticed to a carver and soon became known as a maker of figure-heads which won admiration in many ports in the world. He never worked in marble, confining himself to wood and clay, but gained a high reputation for his statues, busts and ideal figures executed in these materials. He served in the American Revolution and was a member of the city councils of Philadelphia for more than a quarter of a century. Among the most admired of his ship carvings were 'Genius of the United States'; 'Nature'; 'Indian Trader'; 'William Penn'; 'River God.' He also executed 'Exhortation'; 'Praise'; busts of Linnæus, William Barton and Lafayette; statues of 'Winter,' 'Washington' (1814), etc.

RUSH. Many plants growing in moist land having cylindrical stems are called rushes, although generally with a qualifying adjective; as the bulrush (*Typha*), flowering rush (*Butomus*), or scouring rush (*Equisetum*), and some sedges (*Cyperaceæ*). The true rushes, however, are members of the grass-like family *Juncaceæ*, containing about 250 species in the several genera, and distributed throughout the temperate zones. Some are destitute of leaves but have barren flower stems resembling leaves; some have leafy stems, the leaves rounded or somewhat compressed and usually jointed internally; the foliage of others is very narrow, springing from the root. The round stems of the leafless species, sometimes bearing flowers, are popularly called rushes. The presence of this family in a pasture denotes bad drainage, and they are troublesome to farmers, since cattle will touch them only as a last resort. The common bog or soft rush (*Juncus effusus*) is found in wet places throughout the temperate world. It is a typical species, with glabrous tufts attaining perhaps four feet, springing from a stout rootstock and bearing an inflorescence composed of many small greenish grass-like flowers. This species is cultivated in Japan for making mats and with others is employed for the bottoms of chairs, baskets, coarse ropes for binding, etc. The stems of *J. conglomeratus* were formerly gathered by English farmers and stripped of their green rind, leaving exposed a large pith with one even lengthwise rib of rind left to support it. This porous pith was then bleached and dried and dipped in scalding grease, thus becoming the wick of a rude candle, or "rushlight," which gave a good, clear light, and, if two feet long, would burn nearly an hour. These dried rush-piths were also used in place of cotton for wicks in open lamps.

Rushes, with a few sweet herbs, were scattered before processions and were strewn on stages in Shakespeare's time and on the floors

of houses before the advent of carpets. The strewing of rushes in the churches grew into a religious festival conducted with much pomp. There rushes on the floor generally became so filthy from overlong use that to order fresh rushes was a sincere mark of honor to a guest.

Scouring rushes are the hollow, jointed stems of the horsetail (*Equisetum hiemale*) the edipermis of which is impregnated with silica, and was formerly used for scouring metals. See **DUTCH RUSH**.

Bulrushes (*Typha*), or cat-tails, were somewhat employed in the place of true rushes, for mats and chair bottoms, and are also placed between barrel-staves.

RUSH, Scouring. See *Equisetales*, under **FERNs** AND **FERN ALLIES**; **DUTCH RUSH**.

RUSH MEDICAL COLLEGE, located at Chicago, affiliated with the University of Chicago. It is one of the oldest educational institutions in the Northwest, having received its charter in 1837. The first lectures were delivered in 1843 and the first building erected in 1844; a larger building was erected on the same site in 1867. This was burned in the Chicago fire of 1871; and the present clinical building was erected in 1875. In 1887 the college became the Medical Department of Lake Forest University, retaining its autonomy. This relation, however, was dissolved in April 1898, and in the same month the college was affiliated with the University of Chicago (q.v.). The government of the college is vested in the "perpetual board of trustees" incorporated in 1837, of which the governor of the State, the lieutenant-governor and the speaker of the house of representatives are members *ex officio*. The board has control of the financial affairs of the college, appoints the faculty and delegates to the faculty the control of the educational work subject to the rules of the university and the approval of the trustees. By the terms of affiliation the board of trustees is composed of members not belonging to the teaching force of the college. In 1899-1900 the University offered courses corresponding to the work of the freshman year of the Medical College and since 1901 has offered instruction in all of the courses of the first two years of the medical curriculum: in anatomy, neurology, embryology, physiology, physiological chemistry, chemistry, chemistry of medical drugs, toxicology, pathology, bacteriology and pharmacology. All the work of the first two years is given at the university only and the work at the college is clinical, that is, the work of the last two years of the medical course. Students who take the first-year courses matriculate and register both as students of Rush Medical College and as students of the university. Many of the courses of the freshman and sophomore years are required while the courses of the junior and senior years are all elective, a certain amount of work in each department, however, being required for the degree of M.D. The university provides three fellowships for graduates of the college and offers the degree of B.S. to students who comply with the university requirements for that degree. The buildings of the college, distinct from those of the university, are the clinical building, Senn Hall and the laboratory building. The Presbyterian Hospital, adjoining the college, and the

Cook County Hospital, opposite the college, afford material for the clinics. The library contains over 21,000 volumes; the students number over 300. The college is open to women as well as men.

RUSHFORTH, William Henry, American inventor: b. Leeds, England, 11 July 1844; d. Rutherford, N. J., 21 Aug. 1892. He entered a railroad repair shop at 12 and at 19 had become a railroad engineer. He was chief engineer in charge of 13 stationary engines in 1874 and in 1878 came to the United States, where he became engineer in a silk factory at Camden, N. J. He was the author of numerous useful inventions, among them a fire-escape ladder, a series of automatic safety signals and a feed-water heater for utilizing the heat wasted in the smoke boxes of locomotives, the latter receiving a silver medal and a diploma at the Paris Exposition of 1887.

RUSHVILLE, Ill., city, county-seat of Schuyler County, on the Chicago, Burlington and Quincy Railroad, about 53 miles northwest of Springfield and 48 miles east-northeast of Quincy. It was settled 20 Feb. 1826 by Benjamin Chadsey, Levi Green and Thomas Barr, members of a commission that selected a town site. It was incorporated as a village 10 May 1831 and chartered as a city in April 1898. It is in an agricultural and coal mining region; the chief manufactures are a flour mill, machine shop, wagon works, harness shops, bottling works and file factory. It has considerable trade in farm products. The principal public buildings are the county courthouse and the jail. There are six churches, three public graded schools and the Rushville Normal and Business College. The government is vested in a mayor and a council of six members, who hold office for a term of two years. Pop. about 2,500.

RUSHVILLE, Ind., city, county-seat of Rush County, on Flat Rock Creek and on the Cleveland, Chicago, Cincinnati and Saint Louis; the Cincinnati, Hamilton and Dayton; the Pittsburgh, Chicago, Cincinnati and Saint Louis and the Fort Wayne, Cincinnati and Louisville railroads, about 40 miles east-southeast of Indianapolis and 85 miles northwest of Cincinnati. It was settled in 1822, incorporated the same year and chartered as a city in 1882. It is in a fertile agricultural region and has considerable manufacturing interests. The chief manufactures are flour, furniture, machinery, agricultural implements, lumber, bent wood, drain pipe, clothing, clay-working machinery and washing machines. There are nine churches, a high school, public and parish schools, two private schools and a public library. The government is vested in a mayor and council of six members, elected every two years. The city owns and operates the electric-light plant and the waterworks. Pop. 4,925.

RUSK, Jeremiah McLain, American agriculturist: b. Morgan County, Ohio, 17 June 1830; d. Viroqua, Wis., 21 Nov. 1893. He removed to Wisconsin in 1853, engaged in farming, became sheriff and in 1861 was elected to the legislature. In 1862 he entered the Union army, was commissioned major and promoted lieutenant-colonel in 1863. He commanded a regiment in Sherman's Meridian campaign and for services in the Atlanta campaign was

brevetted colonel and brigadier-general in 1865. He was mustered out of service in that year and in 1866-70 served as bank comptroller of Wisconsin. Elected to Congress in 1871 he remained there until 1877 and in 1882-89 was governor of Wisconsin. He was first Secretary of the newly-created Department of Agriculture under President Harrison in 1889-93.

RUSK, Thomas Jefferson, American politician: b. Camden, S. C., 8 Aug. 1802; d. Nacogdoches, Tex., 29 July 1856. He studied law, practised in Georgia, and in 1835 removed to Texas, where he took a prominent part in political affairs. He was a member of the convention which declared the independence of Texas in 1836, was its first Secretary of War, and after the disablement of General Houston took command of the army at San Jacinto. He was chief justice of Texas and in 1845 president of the convention which concluded annexation with the United States. He sat in the United States Senate in 1846-56.

RUSKIN, John, English critic and author: b. London, 8 Feb. 1819; d. Coniston, Lancashire, 20 Jan. 1900. He attended lectures at King's College, London, was trained in drawing and in 1836 went to Oxford, where he became a gentleman-commoner at Christ Church. In 1839, after two failures, he won the Newdigate prize for a poem on 'Salsette and Elephanta.' His first published works were essays in Loudon's *Magazine of Natural History* on geological and allied subjects (1834 and 1836), and in 1837-38 he wrote for Loudon's *Architectural Magazine* on 'The Poetry of Architecture' (separately published, 1893). An attack upon some of Turner's pictures in *Blackwood's Magazine* in 1836 led him to formulate the plan of his 'Modern Painters,' the first volume of which appeared in 1843 as by 'A Graduate of Oxford.' The second volume was published in 1846, the third and fourth in 1856 and the fifth in 1860 (complete edition, imperial 8vo, with all the original and three new plates, six volumes, 1888; 8vo edition, with reduced plates, six volumes 1897). At first intended as a defense of Turner, the work soon assumed a wider scope and became a comprehensive treatise on the principles of art. He sought to show the immense superiority of the best modern landscape painters, especially Turner, to all the ancients, and supported the spiritual against the sensuous theory of art with an eloquence and a breadth of knowledge which have indeed wrought, as Sydney Smith predicted, "a complete revolution in the world of taste." The descriptions of natural scenery in the book are justly regarded as priceless gems of word-painting, and the sense of the indissoluble association of art with all other branches of human activity, so characteristic of Ruskin, became increasingly marked as the work progressed. His name was not put on the title-page till 1851.

After the publication of the first volume of 'Modern Painters' he continued his studies and his travels, and during a visit to Venice he definitely decided upon literature as his main work. In 1848 he married Euphemia Chalmers Gray, the 19-year-old daughter of a Scottish lawyer, for whom he had written in 1841 his fairy tale, 'The King of the Golden River' (published 1851). His married life was not

very fortunate, and in 1854 the marriage was annulled and the lady married the artist Millais in 1855. 'The Seven Lamps of Architecture' (1849) sought to do for architecture what Ruskin had already done for painting. The title and arrangement of the book are characteristic of his whole artistic criticism. All work in architecture, and in all else, should be illumined by the lamps of sacrifice, truth, power, beauty, life, memory and obedience. In 1851 he defended Millais and Holman Hunt, two of the pre-Raphaelite leaders, in letters to the *Times*, and in the same year followed up this advocacy by a work on pre-Raphaelitism, 'The Stones of Venice' (1851-53), the fruit of much close study and arduous toil, is a worthy companion of 'Modern Painters,' and in it, as in the earlier work, we meet the moralist as artist. The chapter 'On the Nature of Gothic Architecture,' in which his economic teaching is distinctly foreshadowed, was reprinted by William Morris at the Kelmscott Press in 1892. In 1854 Ruskin came to know D. G. Rossetti, to whom he was a considerate and generous patron; and he was closely associated with F. D. Maurice, Furnivall and other Christian Socialists in the work of the Working Men's College, where he taught drawing regularly for some seven years. His career as a social reformer may be dated from 1857, when he published a series of lectures on 'The Political Economy of Art' (enlarged edition, entitled 'A Joy for Ever and its Price in the Market,' 1880). His chief works of this kind are 'Unto this Last' (1862; popular edition, 1900), originally written for the *Cornhill Magazine*; 'Munera Pulveris' (1862), partly reprinted from *Fraser's Magazine*; 'Time and Tide by Weare and Tyne' (1867), and 'Fors Clavigera' (1871-84), consisting of letters to the working men and laborers of Great Britain. In these the tendency to exaggeration is clearly manifest, and for a time it stood in the way of the serious consideration of his views. He laid especial stress upon the economic value of healthy, happy, honorable, self-sacrificing life; he directed attention to the vital importance of the problem of distribution and the necessity of economic co-operation; the need for a genuine national system of education, old-age pensions and a radical solution of the housing problem were eloquently set forth by him. In this work Ruskin always professed himself a follower of Carlyle, one of his warmest friends and admirers. Some of his books published after 1855 were collections of lectures. Such are 'The Two Paths' (1859); 'Sesame and Lilies' (1865); 'The Crown of Wild Olive' (1866); 'Work, Traffic, War and The Future of England' (last not in first edition), and 'The Ethics of the Dust' (1866). In 1867 he delivered the Rede lecture at Cambridge on 'The Relation of National Ethics to National Art,' and was awarded the honorary degree of LL.D. by that university, and in 1893 Oxford conferred upon him its D.C.L. degree. In 1871 he was elected lord rector of Saint Andrews University.

The period from 1870 until his retirement from active work was full of new schemes of social usefulness, some of them more generous in conception than practicable, but all bearing eloquent testimony to the absolute sincerity of his preaching of the gospel of social righteousness

and service. In 1871 he founded the Guild of Saint George, and himself paid \$35,000, a tenth of his possessions at that time, into a trust for carrying on its work. The basic principles of the guild were "that food can only be got out of the ground and happiness out of honesty," and in connection with it he started agricultural settlements, some industrial enterprises and the Saint George's (now Ruskin) Museum at Sheffield.

In 1871 he gave up his house at Denmark Hill and purchased his well-known residence at Brantwood, on the shore of Coniston Lake. In 1870 he was appointed first Slade professor of fine arts at Oxford, and held this post until 1879, when he resigned owing to illness, and again from 1883 until 1884, when he again resigned. His lectures at Oxford give the best connected account of his maturer conceptions of art and form the material of the works: 'Lectures on Art' (1870); 'Aratra Rentelici: Six Lectures on the Elements of Sculpture' (1872); 'The Eagle's Nest: Ten Lectures on the Relation of Natural Science to Art' (1872); 'Ariadne Florentina: Six Lectures on Wood and Metal Engraving' (1873-76); 'Val d'Arno: Ten Lectures on the Tuscan Art Directly Antecedent to the Florentine Year of Victories' (1874); 'The Art of England' (1884); 'The Pleasures of England' (1884), and 'Lectures on Landscape Delivered in Lent Term, 1871' (1897). He founded a drawing school at Oxford, and during his professional period he tried the famous and exceedingly characteristic road-digging experiment, in which he set his pupils to work on the roads in order to improve the country. In 1878 he experienced the first of several attacks of brain fever, and from this time his excessive work at an unnaturally high pressure caused his health to break down seriously; 1878 was also the year of Whistler's libel action against him, in which the jury awarded one farthing damages. The most notable work of his period of final retirement, broken only by short journeys in search of health, is 'Præterita: Outlines of Scenes and Thoughts Perhaps Worthy of Memory in My Past Life' (1885-89), the last volume containing 'Dilecta,' or selections from his correspondence. This fragment of autobiography bears little trace of mental decay, but is notable for brilliant description, vivid recollection and excellent portraiture of men whom he had known. Of works not above mentioned the following are the most noteworthy: 'Poems' (1850; privately printed; 2 vols., 1891); 'Examples of the Architecture of Venice' (1851); 'Lectures on Architecture and Painting' (1853); 'Notes on Some of the Principal Pictures Exhibited at the Royal Academy' (1855-59 and 1875); 'The Harbors of England' (1856), with engravings from drawings by Turner; 'Catalogue of the Drawings and Sketches of Turner at present Exhibited in the National Gallery' (1881); 'The Elements of Drawing' (1857), lectures delivered at the Working Men's College; 'Inaugural Address at the Cambridge School of Art' (1858); 'The Oxford Museum' (1859), with H. W. Acland; 'The Elements of Perspective' (1859), lectures delivered at the Working Men's College; 'The Queen of the Air' (1869), lectures on the Greek myths of cloud and storm; 'Mornings in Florence' (1875-77; collected, 1889); 'Proserpina: Studies of Wayside Flowers' (1875-86);

'Deucalion: Collected Studies of the Lapse of Waves and Life of Stones' (1875-83); 'Saint Mark's Rest: the History of Venice' (1877-84; collected, 1884); 'The Laws of Fiésole: A Familiar Treatise on the Elementary Principles and Practice of Drawing and Painting' (1877-78); 'Notes on the Drawings by Turner Exhibited at the Fine Art Society's Galleries' (1878; new ed., 1900); 'Arrows of the Chace' (1880), a collection of newspaper letters; 'The Bible of Amiens' (1880-85); 'On the Old Road' (1885), a collection of miscellaneous writings. In 1871 a collective edition of his works was begun, but extended to only 11 volumes. E. T. Cook was supervising a new complete edition of his works begun in 1903 and to be finished in 30 volumes. This "library edition" is now one of the greatest tributes to Ruskin's memory.

There is a complete bibliography by T. J. Wise and J. P. Smart (1893). Ruskin prepared the plates, or at least the drawings, for many of his own works, and also painted some landscapes, chiefly in water color. A loan exhibition of his drawings was held in the Royal Water Color Society's rooms in 1901.

To what has already been said of the work and message of Ruskin little need be added. He was essentially a prophet, on fire with the enthusiasm of humanity, almost fierce in his opposition to every kind of insincerity and injustice. His early religious views were narrow, but in middle life he advanced to a broadly liberal position of no distinctively Christian character, though in later years he added to his religious liberalism a more definitely Christian element. What he said of 'Modern Painters' may be applied to all his work: "It declares the perfectness and eternal beauty of the work of God; and tests all work of man by concurrence with, or subjection to that." His teaching has been spread by many Ruskin societies, a Ruskin Hall for working men has been established at Oxford, and at Ruskin, Tenn., a co-operative colony was unsuccessfully attempted. (See MODERN PAINTERS; SEVEN LAMPS OF ARCHITECTURE; STONES OF VENICE). Consult Collingwood, 'Life and Work of John Ruskin' (1893), and 'Life of John Ruskin' (1900); Ritchie, 'Records of Tennyson, Ruskin and Browning' (1892); Spielmann, 'John Ruskin' (1900); Harrison, 'Tennyson, Ruskin, Mill and Others' (1899); Rossetti, 'Ruskin, Rossetti and Pre-Raphaelitism' (1899); Cook, 'Studies in Ruskin' (2d ed., 1891); Hobson, 'John Ruskin, Social Reformer' (1898); Mallock, 'New Republic' (1881 — Herbert represents Ruskin); Sizeranne, 'Ruskin et la religion de la Beauté' (1897; Eng. trans., 1899); Smart, 'A Disciple of Plato' (1883); Waldstein, 'The Work of John Ruskin' (1894); Mather, 'Life and Teaching of John Ruskin' (5th ed., 1898); Harrison, 'John Ruskin' (1902; 'English Men of Letters,' new series); Mackail's essay in Chambers' 'Cyclopædia of English Literature' (Vol. III, 1904); Kitchin, 'Ruskin at Oxford and Other Essays' (1904).

RUSLING, James Fowler, American soldier: b. Washington, N. J., 14 April 1834. He was graduated from Dickinson College in 1854 and was professor of natural science at Dickinson Seminary, Williamsport, Pa., in 1854-57, when he engaged in law practice. At the out-

break of the Civil War he entered the Union army with rank as lieutenant. He served in the Army of the Potomac in 1861-63, in the Department of the Cumberland in 1863-65, and in the War Department in 1865-67. He attained rank as colonel of volunteers in 1865, was brevetted brigadier-general in 1866, and mustered out of service in 1867. He was United States pension agent for New Jersey in 1868-77 and has published 'Across America, or the Great West and Pacific Coast' (1874); 'History of Pennington Seminary' (1890); 'Men and Things I saw in Civil War Days' (1899); 'European Days and Ways' (1902); 'History of the Rusling Family' (1908), etc.

RUSS, John Denison, American physician and philanthropist: b. Chebacco (Essex), Mass., 1 Sept. 1801; d. Pompton, N. J., 1 March 1881. He was graduated from Yale in 1823, studied medicine in the United States, in London, and on the Continent, in 1826 began practice in New York, in 1827-30 was in Greece aiding the patriots, and upon his return began the first instruction of the blind attempted in the United States. He was invited to organize the Institution for the Blind in Boston, but preferred to continue his independent work. In 1832 he became superintendent of the New York institution, a post which he resigned in 1858. His inventions and improvements for the assistance of the blind were widely used. Latterly he was active in endeavors to improve prison discipline and further the welfare of discharged prisoners.

RUSSELL, Benjamin, American journalist: b. Boston, Mass., 13 Sept. 1761; d. there, 4 Jan. 1845. He was apprenticed to Isaiah Thomas, publisher of the Worcester, Mass., *Spy*, but entered the Revolutionary army before completing his apprenticeship, and there collected war news for that paper. In 1784 he established the *Columbian Sentinel*, which he made the most powerful organ of the Federal party in New England, and which he edited until 1828. He also established and conducted in 1795-1830 the *Gazette*, likewise a Federalist organ. He printed the laws and State documents during the first sessions of Congress and refused to receive pay for his work until it was pressed upon him by Washington; represented Boston in the general court for 24 years; served several terms in the Massachusetts senate; was a member of the executive council, and of the constitutional convention in 1820.

RUSSELL, Bertrand (Arthur William), English philosopher, mathematician and pacifist: b. Trelleck, Monmouth, 18 May 1872. He is a grandson of Lord John Russell, and the heir presumptive of the second Earl, his brother. He received his education at Trinity College, Cambridge, where he later became Fellow and lecturer. He also spent some terms at Oxford and in the spring of 1914 lectured at Harvard University. In 1915 he received the Butler gold medal from Columbia University for the most distinguished work in philosophy or education during the preceding five years. After the beginning of the European War, he was vigorous in his attempts to obtain peace by understanding. On 14 July 1916 he was deprived of his lectureship at Trinity on account of his pacifistic activities, which had caused him to incur a fine under the Defense of the Realm Act, and was

later prevented from coming to Harvard for a second period of lecturing on account of the refusal of the British government to let him leave the country. In 1917 he was sentenced to six months' imprisonment on account of repeated violations of the Defense of the Realm Act. Russell is the protagonist of the new mathematical logic, and at the same time perhaps the most skilled dialectician among the adherents of the New Realism. His pacifism is intimately connected with an attitude toward the contemplative life which almost takes the form of a worship. He has written 'German Social Democracy' (1896); 'Essay on the Foundations of Geometry' (1897); 'The Philosophy of Leibniz' (1900); 'The Principles of Mathematics' (1903); 'Philosophical Essays' (1910); 'Principia Mathematica' (1910); with A. N. Whitehead, 'Problems of Philosophy' (1911); 'The Philosophy of Bergson' (1914), with H. W. Carr; 'Our Knowledge of the External World as a Field for Scientific Method in Philosophy' (1914); 'Scientific Method in Philosophy' (1915); 'Mysticism and Logic' (1918); 'Why Men Fight' (1916); 'Principles of Social Reconstruction' (1917); 'Political Ideals' (1918).

RUSSELL, Sir Charles Arthur, Baron of Killowen, English jurist: b. Newry, Ireland, 10 Nov. 1832; d. London, 10 Aug. 1900. He began his career as solicitor in 1854, later matriculated at Trinity College, Dublin, but did not graduate; and in 1856 removed to London, entered Lincoln's Inn and was admitted to the English bar in 1859. In 1872 he was made queen's counsel, and entered Parliament for Dundalk in 1880, but his part in debate was largely confined to questions concerning Ireland. In 1885 he was returned for South Hackney and became attorney-general in Gladstone's Cabinet in 1886. His speeches in behalf of home rule were his most notable parliamentary achievements. He was leading counsel for Parnell in the investigations brought about by the Parnell Commission Act of 1888, and his six days' speech concluding the trial on 12 April 1889 is accounted his greatest forensic effort. He defended the prisoner in the Maybrick murder trial; in 1893 represented Great Britain in the Bering Sea arbitration; in 1894 was made lord of appeal; was raised to a life-peerage as baron of Killowen, and later succeeded Lord Coleridge as lord chief justice. In 1896 he delivered an address before the American Bar Association at Saratoga, on 'Arbitration: its Origin, History and Progress.' In 1899 he succeeded Lord Herschell as one of the arbitrators to determine the boundaries between British Guiana and Venezuela. His publications aside from his address on arbitration were mainly contributions to current discussions.

RUSSELL, Charles Edward, journalist and author: b. Davenport, Ia., 25 Sept. 1860. He was graduated at Saint Johnsbury Academy, Vermont, 1881; had a varied experience on several newspapers; was publisher of the *Chicago American* until 1 Jan. 1902, and later editorial writer on the *New York American*. From 1904 he contributed to periodical literature and lectured on sociological and literary topics. In 1910 and in 1912 he was the candidate of the Socialist party for the governorship of New York. In 1917 he was a member of the special

diplomatic mission sent to Russia by the United States government. He is author of 'Such Stuff as Dreams' (1902); 'The Twin Immortalities' (1904); 'The Greatest Trust in the World' (1905); 'The Uprising of the Many' (1907); 'Lawless Wealth' (1908); 'Thomas Chatterton, the Marvelous Boy' (1908); 'Songs of Democracy' (1909); 'Why I am a Socialist' (1910); 'Business, the Heart of the Nation' (1911); 'Stories of the Great Railroad' (1912); 'These Shifting Scenes' (1914); 'The Story of Wendell Phillips' (1915); 'Unchained Russia' (1918).

RUSSELL, Charles Taze ("Pastor Russell"), American independent clergyman: b. Pittsburgh, Pa., 16 Feb. 1852; d. 31 Oct. 1916. He was privately educated and was in early life a Congregationalist. He began his career as an independent minister at Pittsburgh in 1878, later serving at the Brooklyn Tabernacle and the New York City Temple. He disclaimed being a founder of a new sect, but had about 50,000 followers of his teachings, writings and methods of Bible study. He interpreted the punishment of the Bible as eternal death, and believed in imminent millenium. He edited a semi-monthly journal *Zion's Watch Tower and Herald of Christ's Presence*, and was author of 'Food for Thinking Christians—Why Evil Was Permitted' (1881); 'Tabernacle Shadows of Better Sacrifices' (1881); and of a series originally published as 'Millennial Dawn' (1886-1904) and later revised and reissued as 'Studies of the Scriptures.' Of these volumes about 3,000,000 copies were sold.

RUSSELL, Charles William, Irish Roman Catholic theologian and educator: b. Killough, County Down, 14 May 1812; d. Dublin, 26 Feb. 1880. He was educated at Maynooth College, where he became connected with the faculty in 1835, taking the chair of ecclesiastical history in 1845, and becoming president in 1857. He was a noted antiquarian scholar and was prominently connected with the Tractarian movement, Cardinal Newman acknowledging his conversion to Roman Catholicism to be largely due to Russell. He was appointed to the Historical Manuscripts Commission in 1869, and was joint author of 'A Report on the Carte MSS. in the Bodleian Library' (8 vols., 1871); he was joint translator of Schmid's 'Catholic Tales' (3 vols., 1846), and of Leibnitz' 'System of Theology' (1850). Author of 'Life of Cardinal Mezzofanti' (1858). He also compiled 'Calendar of Irish State Papers during the Reign of James I' (4 vols., 1872-77).

RUSSELL, David Allen, American soldier: b. Salem, N. Y., 10 Dec. 1820; d. near Winchester, Va., 19 Sept. 1864. He was graduated from West Point in 1845, served in the Mexican War and in 1847 was brevetted 1st lieutenant for gallant conduct. He subsequently served on the Pacific Coast, was brevetted captain in 1854, later took part in the Mexican War, and at the outbreak of the Civil War was assigned to aid in the defense of Washington. In 1862 he was appointed colonel and served in the Peninsular campaign under McClellan. He commanded a brigade in the Rappahannock campaign, was brevetted colonel in the regular army, assisted in the capture of the Rappahannock station and commanded a division at the battles of the Wilderness, Spottsylvania and

North Anna. He was engaged in the defense of Washington in August and September 1864, and was killed while leading his column at Opequan, Va., 19 Sept. 1864. He was brevetted major-general of the regular army the same day.

RUSSELL, George W. ('A. E.'), an Irish poet: b. 1867. He studied art in Dublin, and his paintings received favorable comment from George Moore. He became a great student of Eastern philosophy and transcendentalism, which developed his own tendency toward mysticism. He is also a man of practical sense in political questions and his advice has often been accepted by Sir Horace Plunkett and the Irish radicals. His poems are charming in quality, and rank with the best verse produced by the Irish Literary Revival. Among his poetical works are 'Homeward: Songs by the Way' (1894); 'The Earth Breath and Other Poems' (1897); a selection of his poems called 'Nuts of Knowledge' (1903); 'The Divine Vision and Other Poems' (1904); 'The Spirit of England' (1915); 'Collected Poems' (1915); and a three act drama in prose, 'Deirdre,' which was performed several times by the the Irish National Theatre society. His political works are 'Co-operation and Nationality' (1913); 'The National Being: Some Thoughts on Irish Policy' (New York 1916); 'Nationality and Imperialism' (in 'Ideals in Ireland' by Lady Gregory, 1901; pp. 13-22); 'The Irish Home-Rule Convention' (three essays, the other two by Sir Horace Plunkett and John Quinn, New York 1917); Russell's essay 'Thoughts for a Convention,' attempts to analyze the mood and demands of the various factions in his country.

RUSSELL, George William Erskine, English statesman and author: b. London, 3 Feb. 1853; d. 17 March 1919. He was educated at University College, Oxford. He served in Parliament in 1880-85 and was returned in 1892. He was Parliamentary Secretary of the Local Government Board in 1883-85; Under Secretary of State for India in 1892-94; and of the Home Department in 1894-95. He was alderman of the city council of London in 1889-95, and became a Privy Councillor in 1907. His social and political connections added to the interest felt in his writings. He wrote 'Collections and Recollections' (2 series, 1898-1903); 'Edward King, 60th Bishop of Lincoln' (1912); 'The Spirit of England' (1915); 'Portraits of the Seventies' (1916); 'Politics and Personalities' (1917); 'Basil Wilberforce, a Memoir' (1918); 'Lady Victoria Baxton' (1919), etc., bright and entertaining pictures of contemporary life which will be of service to future social historians.

RUSSELL, Harry Luman, American bacteriologist and educator: b. Poynette, Wis., 12 March 1866. He was graduated at the University of Wisconsin in 1888, and later studied at Berlin, the Pasteur Institute, Paris, the Zoological Station, Naples, and in 1892 took his Ph.D. at Johns Hopkins. From 1893 he was a member of the faculty at the University of Wisconsin, where he has been Dean of the Agricultural College and Director of the Experiment Station since 1907. He was also Director of the State Hygienic Laboratory in 1903-08. Author of 'Outlines of Dairy Bac-

teriology' (1894-1905); and of the 'Reports' and 'Bulletins' of the Wisconsin Experiment Station since 1893. He is joint author of 'Public Water Supplies' (1910); 'Agricultural Bacteriology' (1915), etc.

RUSSELL, Henry, English singer and song writer: b. Sheerness, Kent, 24 Dec. 1812; d. Maida Vale, 8 Dec. 1900. He made his first appearance on the stage at the age of three, and later studied at Bologna and at Naples. He toured Canada and the United States in 1833-41, giving recitals of his own songs with great success, which was afterward duplicated in London and the Provinces. He also produced an entertainment 'The Far West,' which not only was successful but greatly stimulated immigration to western America. He composed the music for about 800 songs, among which were 'Cheer, Boys, Cheer'; 'There's a Good Time Coming'; 'A Life on the Ocean Wave,' etc. His reminiscences were published under the title of his greatest song success, 'Cheer, Boys, Cheer' (1895).

RUSSELL, Henry Benajah, American journalist: b. Russell, Mass., 9 March 1859. He was graduated from Amherst in 1881, was attached to the New York Sun 1884-88, was on the editorial staff of the Providence Journal 1888-90, and of the Hartford Post 1890-97. Editor of Springfield Homestead 1902-13, editorial writer Hartford Times 1913. He has published 'Life of William McKinley' (1896); 'International Monetary Conferences' (1898); 'Our War with Spain' (1899).

RUSSELL, Howard Hyde, American Congregational clergyman: b. Stillwater, Minn., 21 Oct. 1855. He took his degree in law at Indianola College, Iowa, and later was graduated at the Oberlin Theological Seminary. He practised law at Corning in 1878-83, and was ordained in the Congregational ministry in 1885. He held various pastorates until 1893, when he founded the Anti-Saloon League in Ohio. He acted as its superintendent until 1897, when he became superintendent of the National Anti-Saloon League of America; he filled that position with the New York Anti-Saloon League in 1901-09, since when he has been associate general superintendent of the National Anti-Saloon League of America. Author of 'A Lawyer's Examination of the Bible' (1893).

RUSSELL, Irwin, American poet: b. Port Gibson, Miss., 3 June 1853; d. en route to California, 23 Dec. 1879. He was graduated at the University of Saint Louis in 1869, studied law and was admitted to the bar at 19 years of age, the age limit of 21 being overruled by the legislature because of his brilliant examination. He abandoned law for literature in 1876, established himself in New York and there speedily gained a reputation for his verse, which was characterized by unusual grace and strength. He also made a reputation for his verses delineating negro character, many of which were published in the *Century Magazine*. His works were published with an appreciative introduction by Joel Chandler Harris (1888).

RUSSELL, Israel Cook, American geologist: b. near Garrattsville, N. Y., 10 Dec. 1852; d. Ann Arbor, Mich., 1 May 1906. He was educated at the College of the City of New York and Columbia School of Mines, and accom-

panied the United States expedition to New Zealand to observe the transit of Venus. In 1875 he became assistant professor of geology at Columbia, and from 1880 was attached to the United States geological survey, for which he made surveys in the Rocky Mountains, Southern Appalachian regions and in Alaska. In 1879 he ascended the Yukon and made his way to Lynn Canal, and in 1890-91 led expeditions to Mount Saint Elias. In 1892 he became professor of geology at the University of Michigan. His contributions to geography and geology embrace 'Geological Reconnaissance in Central Oregon' (1883); 'Geological History of Lake Lahontan' (1885); 'Quaternary History of Mono Valley, California' (1887); 'Existing Glaciers of the United States' (1889); 'Sub-aerial Decay of Rocks' (1889); 'A Second Expedition to Mount Saint Elias' (1892); 'A Geological Reconnaissance in Central Washington' (1893); 'Lakes of North America' (1895); 'Present and Extinct Lakes of Nevada' (1895); 'Glaciers of North America' (1897); 'Volcanoes of North America' (1897); 'Rivers of North America' (1898).

RUSSELL, John, 1st EARL RUSSELL, English statesman, third son of John, 6th duke of Bedford: b. London, 18 Aug. 1792; d. Richmond Park, Surrey, 28 May 1878. He was educated at Edinburgh University, where he trained himself to debate at the meetings of the Speculative Society. In July 1813 he entered Parliament and soon gained prominence among the politicians of the day. He early took up the subject of parliamentary reform and supported the repeal of the Test and Corporation Acts and Roman Catholic emancipation. In 1828 he had the satisfaction of seeing the Test and Corporation Acts repealed by the Wellington ministry, and in April 1829 the Catholic Relief Bill became law. When the Grey Cabinet was formed in 1830 Lord John Russell, then paymaster-general of the forces, was elected one of the committee of five to formulate a Reform Bill. This was brought before the House of Commons, 1 March 1831, by him, and though he defended it clause by clause with extraordinary vigor, it was ultimately rejected. Upon this the Whig ministry resigned and an appeal made to the country. The elections resulted in a majority favorable to the bill, which received the royal sanction 7 June 1832. In Lord Melbourne's second Cabinet (1835-41) he was at first Home Secretary and then Colonial Secretary, and on the outbreak of the Canadian rebellion, by recognizing the right of the colonies to self-government, reconciled them to the mother country. From 1841 (in which year he became member for the city of London) to 1845, during the Peel administration, Lord John Russell led the opposition, but lent his influence in favor of the repeal of the corn-laws. He was Premier 1846-52, and was able to pass his Ecclesiastical Titles Bill of 1851, prohibiting the assumption of the territorial titles by Roman Catholic bishops. Lord Derby, who followed him, soon resigned and under the succeeding administration of Lord Aberdeen, Russell was Foreign Secretary for a short time. He also filled the post of lord-president of the council from June 1854 to February 1855. He was Colonial Secretary under Lord Palmerston in 1855, and represented Great Britain in the Vienna conferences; but his con-

duct of the negotiations brought him so much unpopularity that he resigned in July of that year. When Palmerston returned to power in 1859 Lord John again became Foreign Secretary, with a seat in the Cabinet. He took a leading part in regard to such political questions as the oppression of the Poles by Russia, the aggressive policy of German powers toward Denmark and the disputes between England and the United States as to the neutrality observed during the continuance of the Civil War. He retained his seat for the city of London from June 1841 until July 1861, when he was raised to the peerage as Earl Russell. After the death of Lord Palmerston, 18 Oct. 1865, Earl Russell became Prime Minister for the second time, Gladstone taking the lead in the House of Commons. During the session of 1866, in conjunction with Gladstone, he introduced a new Reform Bill, which, failing to pass, the ministry resigned and was succeeded by that of Lord Derby. Thenceforth Earl Russell held no office in any ministry, though he always took an active part in promoting Liberal measures.

He published among other works 'History of the British Constitution' (1821); 'Essay on the History of the English Government' (1823); 'Memoirs of the Affairs of Europe' (1824-29); 'Essay on the Causes of the French Revolution' (1832); 'Memoirs and Correspondence of Thomas Moore' (1852-56); 'The Life and Times of Charles Fox' (1859-66); 'Selections from Speeches of Earl Russell, 1859 to 1865'; 'Recollections and Suggestions, 1813-73' (1875). Consult Walpole, 'Life of Lord John Russell' (1889); Reid, 'Lord John Russell' (1895); Russell, R., 'Early Correspondence of Lord John Russell' (2 vols., London 1913).

RUSSELL, John Scott, Scottish engineer and naval architect: b. Glasgow, 8 May 1808; d. Ventnor, Isle of Wight, 8 June 1882. He was educated at the universities of Edinburgh, Saint Andrews and Glasgow, graduating from the latter at 16. In 1832 he was professor of natural philosophy in Edinburgh University. During his researches into the nature of waves he discovered the existence of the wave translation, on which he founded the wave-line system of construction of ships introduced into practice in 1835. In 1844 he removed to London and was for many years a well-known shipbuilder on the Thames. He became joint-secretary of the Royal Commissions for carrying out the Great Exhibition of 1851 and took a leading part in organizing it. He built the *Great Eastern*; was joint-designer of the first English seagoing armored frigate, the *Warrior*, and constructed the vast dome of the Vienna Exhibition of 1873. He published 'The Modern System of Naval Architecture for Commerce and War' (1864-65); 'Systematic Technical Training for the English People' (1869); and 'The Wave of Translation in the Ocean of Water, Air and Ether' (new ed., 1885).

RUSSELL, Lillian (HELEN LOUISE LEONARD), American comic opera singer: b. Clinton, Iowa, December 1861. She sang in 'Pinafore' under E. E. Rice in 1879, and later appeared in New York at Tony Pastor's Theatre. She soon became the star in the McCall Opera Company and played leading parts in 'Snake Charmer,' 'Olivette,' 'Patience' and 'The Sorcerer.' She sang in London in 1883 and returned to New

York in 1885, from which date until 1891 she sang at the Casino in various rôles, and later at Weber and Fields' Music Hall. She long retained her hold as a popular favorite and finally retired from the stage, but still kept in prominence by journalistic contributions and advice on topics of general feminine interest.

RUSSELL, William, Lord, English statesman: b. 29 Sept. 1639; d. London, 21 July 1683. He was educated at Cambridge, was elected to Parliament for Tavistock in 1661 and became one of the leaders of "the country party" in 1673, coming forward in opposition to the attempts of the king and his partisans to destroy English freedom through the aid of France. In 1678 he became Lord Russell and heir apparent to the earldom of Bedford. On 14 March 1678 he seconded the motion to declare war against France and spoke in support of it. In November 1678 he was chosen to move in the House of Commons that the Duke of York should be removed from the king's presence and councils. When the new council proposed by Sir William Temple was formed Lord Russell was appointed one of the 30 members. He was not at first in favor of excluding the Duke of York from the succession, but finally supported the measure. He left the council at the beginning of 1680. On 26 October he spoke in favor of measures against "popery and to prevent a popish successor" to the Crown; and a week later seconded Colonel Titus' motion to disable the Duke of York from becoming King of England. When the reaction against the Whigs took place, the government of Charles II resolved to destroy their leaders, proceeding to do so according to the forms of law. He was arrested on the charge of having been concerned in the Rye House plot, said to have been formed by Rumboldt and others, for an attack on the king and the Duke of York, and after his examination was committed to the Tower. His trial took place at the Old Bailey, 13 July 1683. The charge against him was "for conspiring the death of the king and consulting and agreeing to stir up insurrection; and to that end to seize the guards (appointed) for the preservation of the king's person." No counsel was then allowed to the accused, except on points of law; his condemnation quickly followed and he was beheaded in Lincoln's Inn Fields. Consult 'Life of William, Lord Russell,' by Lord John Russell (1819).

RUSSELL, William Clark, English novelist: b. New York, 24 Feb. 1844; d. 1911. Educated at Winchester and Boulogne, he was a midshipman in the merchant service 1857-65. His first sea-story, 'John Holdsworth, Chief Mate,' appeared in 1874 and was very successful; but he won still greater success with 'The Wreck of the Grosvenor' in the following year. Among his numerous novels are 'An Ocean Free Lance' (1878); 'My Shipmate, Louise' (1882); 'A Sea Queen' (1883); 'An Ocean Tragedy' (1881); 'Alone on a Wide, Wide Sea' (1892); 'The Emigrant Ship' (1894); 'The Convict Ship' (1895); 'What Cheer!' (1895); 'List, Ye Landsmen!' (1897); 'The Two Captains' (1897); 'Romance of a Midshipman' (1898); 'A Voyage at Anchor' (1899); 'The Pretty Polly' (1900); 'The Ship's Adventure' (1899); 'His Island Princess' (1905); several collections of short

stories, and lives of Nelson (1890) and Collingwood (1891). He was for some time connected with the *Newcastle Daily Chronicle*, but for several years, ending in 1887, was on the staff of the *London Daily Telegraph*.

RUSSELL, William Eustis, American lawyer and political leader: b. Cambridge, Mass., 6 Jan. 1857; d. Little Palos, Quebec, Canada, 16 July 1896. He was graduated from Harvard in 1877, and from the Boston University Law School in 1879, winning the Lawrence prize for the best legal essay. He was admitted to the Massachusetts bar in 1880 and began the practice of law with his father's firm. He also became an active member of the Democratic party; was elected to the common council of Cambridge in 1881, to the board of aldermen in 1883 and 1884; and was mayor of the city 1885-87. His efficient administration as mayor, and his effective campaign speeches during the Presidential campaign of 1884, had made him a prominent figure in State politics, and in 1888 he was the Democratic nominee for governor. He was defeated in that year and again in 1889, but in 1890 was elected and twice re-elected in 1891 and 1892. He took an active part in all his gubernatorial campaigns, making numerous speeches in all parts of the State. His election as governor for three successive years was a remarkable testimony to his personal integrity and popularity, as the majority of the legislature and the State officials were Republicans. Several laws were passed on his recommendation, including a measure to regulate the lobby, and a law abolishing the property qualification for governor and the poll tax. At the close of his term he resumed the practice of law, and in 1894 was appointed a member of the board of Indian commissioners. In 1896 he was one of the most active opponents of the adoption of the free silver platform at the Democratic National Convention, and distinguished himself by a remarkable speech pleading for a return to the original principles of the Democracy; he was prominently mentioned as a candidate for the presidency by those who favored the gold standard. His death occurred suddenly, shortly after the convention, and was thought to be due largely to the strain he had undergone at that time.

RUSSELL, Sir William Howard, English journalist: b. near Dublin, Ireland, 28 March 1820; d. London, England, 10 Feb. 1907. He was educated at Trinity College, Dublin, and was called to the bar in 1852. His journalistic career began in 1843 on the staff of the *London Times*. He was its special correspondent during the Danish war of 1848-50, during the Crimean war, in 1854-56, reported the Indian mutiny in 1857-58, the Italian campaign 1859, the Civil War in the United States in 1861-62, the Danish war of 1864, the Prusso-Austrian war 1866, and the Franco-Prussian war of 1870. He accompanied the Prince of Wales to Egypt in 1868 and was his honorary private secretary on his visit to India in 1875. In 1879-80 he was again engaged as war correspondent in South Africa, and in 1883-84 was on that duty in Egypt. He was knighted in 1895 and was editor of the *Army and Navy Gazette*. His publications include 'British Expedition to Crimea'; 'Diary in India'; 'My Diary—North and South' (1863); 'The Prince of Wales Tour' (1877); 'Hesperothen' (1882); 'The Great War

with Russia' (1895); 'Totleben's Sebastopol', etc.

RUSSELL SAGE FOUNDATION, an institution established in April 1907, by Mrs. Russell Sage, with an endowment of \$10,000,000, for the improvement of social and living conditions in the United States of America. It does not attempt to relieve individual or family needs, but by study and investigation to eradicate the causes of distress. The work is distributed among several departments, including the Charity Organization Department, Department of Child Helping, Division of Remedial Loans, Department of Surveys and Exhibits, Division of Recreation and Division of Education. Publications are issued by each department. The Division of Education has made contributions to the subject of medical inspection of the schools, and to the question of retardation and elimination of pupils. The Division of Recreation has done much to develop the community centre idea; and the Division of Remedial Loans has thrown much light on the methods of loan sharks and promoted co-operative loan societies. The Foundation has also supervised the development of the model suburban community at Forest Hills, Long Island. The Department of Surveys and Exhibits has, by its constant efforts, kept the community informed of its problems and thereby has served to educate public opinion. Consult Ayres, L. P., 'Seven Great Foundations' (New York 1911).

RUSSELL'S VIPER, one of the largest and most venomous serpents (*Daboia russelli*) of the East Indian region; justly dreaded throughout southern and eastern India, Ceylon, Burma and Siam. It may reach a length of five feet, and is yellowish-brown with three longitudinal series of black, light-edged rings, which sometimes encircle reddish spots. It is known also as chain-viper, tic-palanga (Ceylon), etc., and is regarded by experts as the most deadly in India. Fortunately, however, it is neither as numerous nor as easily provoked as the cobra. According to Fayrer it is nocturnal in its habits, sluggish and does not readily strike unless irritated, when it bites with great fury; moreover its loud hissing when disturbed is likely to give one sufficient warning to enable him to jump out of reach. It is said to kill many grazing cattle. The action of its poison resembles that of the rattlesnake, but gives rise to hæmorrhagic extravasations from the kidneys and various other organs. Consult Fayrer, 'Thanatophidia of India' (1874); Gadow, 'Amphibia and Reptiles' (1901).

RUSSELLVILLE, Ark., town, county-seat of Pope County, on the Saint Louis, Iron Mountain and Southern and the Dardanelle and Russellville railroads, about 80 miles northwest of Little Rock. It is in an agricultural region in which the chief product is cotton. The lumber interests are quite important. The principal manufactures are cotton, dairy and lumber products, flour and agricultural implements. The two banks, one Na-

tional and one State, have a combined capital of \$80,000. Pop. 2,936.

RUSSELLVILLE, Ky., city, county-seat of Logan County, on the Louisville and Nashville Railroad, about 25 miles west-southwest of Bowling Green and 52 miles north by west of Nashville. It is in an agricultural region in which tobacco is one of the chief products. The principal manufacturing establishments are flour mills, tobacco factories, wagon and carriage works and furniture factories. It contains the Logan Female College (M. E. S.), established in 1867, the Bethel College (Baptist), founded in 1854, public schools and a public library. The three State banks have a combined capital of \$175,000. Pop. about 3,000.

RUSSELLVILLE, Engagements at. After the defeat of Gen. W. E. Jones at Morristown, Tenn. (q.v.), 10 Dec. 1863, he was followed by a Union force under Colonel Graham, and when near Russellville, Graham ran into General Morgan's cavalry division, which was foraging. Graham was attacked and driven back, leaving some dead, wounded and prisoners in the hands of the Confederates. Late in October 1864 Col. J. B. Palmer, 58th North Carolina, with about 800 men and three guns, moved from North Carolina into East Tennessee to co-operate with the Confederate troops under General Vaughn, and 28 October he was ordered by Vaughn to take position in the rear of Russellville, on the Bull's Gap road. He had scarcely taken position when Vaughn's brigade, defeated at Morristown, swept past him in great disorder. He formed line, threw out skirmishers, and opened fire with his three guns upon Gillem's pursuing troops, checking them and enabling Vaughn to rally about 200 of his men. General Gillem, who with a brigade, was at Henderson's Depot on 8 Nov. 1864, hearing that General Breckinridge was advancing to reconquer East Tennessee, fell back to Greeneville on the 9th and to Bull's Gap on the 10th, where he was attacked on the morning of the 11th by General Duke's cavalry brigade, but held his own during the day. The attack was renewed by Breckinridge on the 12th with artillery; he next assaulted in front and in rear with cavalry, both being repulsed. Breckinridge again renewed the attack on the 13th, and kept it up all day. Gillem being now almost out of ammunition, and without food for his men and forage for his horses, abandoned his position during the night and fell back toward Russellville. He took position on the road, at its intersection with the Knoxville and Greeneville road, intending to hold that point until his trains had passed it. Nearly all his trains had passed, and were going through Russellville, when, on the 14th, his rear was attacked by Breckinridge with the brigades of Duke and Vaughn. His men were thrown into disorder, became panic-stricken, could not be rallied and retreated through Russellville to Strawberry Plains. He had 41 killed and wounded, and lost six guns, 132 wagons and ambulances, and 300 horses. About 200 of his men were captured. Consult 'Official Records' (Vols. XXXI and XXXIX).
